Adhesion Problems In The Recycling Of Concrete:

Adhesion Problems in the Recycling of Concrete Pieter C. Kreijger, 2013-03-09 The building explosion during the years 1945 1960 will inevitably lead to increased demolition in the next decades since the lifetime distribution of structures no longer fulfills its functional social requirements in an acceptable way In the building period mentioned there was a great increase in reinforced and prestressed concrete construction Consequently there is now more and more concrete to be demolished Increasingly severe demands will be made upon demolition technology including the demand for human and environment friendly techniques On the other hand the possibility of disposing of debris by dumping is steadily diminishing especially close to major cities and generally in countries with a high population density At the same time in such countries and in such urban areas a shortage of aggregates for making concrete will develop as a result of restrictions on aggregate working because of its effect on the environment and because of the unavailability of aggregate deposits due to urban development From the foregoing it follows that recycling and re use of environment and human friendly demolished and fragmented building rubble should be considered The translation of this general problem into terms of materials science is possible by forming clear ideas of adhesion and cohesion the whole process of demolition fragmentation and recycling or re use of concrete is to break the bonding forces between atoms and molecules and to form new bonds across the interfaces of various particles of either the same nature or a different nature

Recycling of Demolished Concrete and Masonry T.C. Hansen, 1992-05-28 This new RILEM report contains state of the art reviews on three topics recycling of demolished concrete recycling of masonry rubble and localized cutting by blasting of concrete It has been compiled by an international RILEM Committee and draws on research and practical experience worldwide

,2003 **Recent Advances on Green Concrete for Structural Purposes** Joaquim A.O. Barros,Liberato Ferrara,Enzo Martinelli,2017-05-29 This book is mainly based on the results of the EU funded UE FP7 Project EnCoRe which aimed to characterize the key physical and mechanical properties of a novel class of advanced cement based materials incorporating recycled powders and aggregates and or natural ingredients in order to allow partial or even total replacement of conventional constituents More specifically the project objectives were to predict the physical and mechanical performance of concrete with recycled aggregates to understand the potential contribution of recycled fibers as a dispersed reinforcement in concrete matrices and to demonstrate the feasibility and possible applications of natural fibers as a reinforcement in cementitious composites All of these aspects are fully covered in the book The opening chapters explain the material concept and design and discuss the experimental characterization of the physical chemical and mechanical properties of the recycled raw constituents as well as of the cementitious composite incorporating them The numerical models with potentialities for describing the behavior at material and structural level of constructions systems made by these composites are presented Finally engineering applications and guidelines for production and design are proposed **Recycling of Road Pavement Materials in the Netherlands** J.
