

A Developmental Psychopathology Perspective on Adolescence

Developmental psychopathology offers an integrative framework for conceptualizing the course of development during adolescence, with particular relevance for understanding continuity and the emergence of psychopathology during this and subsequent developmental periods. In this article, the utility of a developmental psychopathology perspective for informing the design of research, prevention, and intervention is highlighted. Interdisciplinary, organizational models of development, emphasizing the dynamic relations between the developing individual and internal and external contexts, are discussed. Examination of boundaries between abnormal and normal development during adolescence offers important vantage points for articulating diversity in the developmental course during this period. Conceptualizing divergence and convergence in developmental pathways, continuity and discontinuity in development, and the transactions of risk and protective processes leading to maladaptation, psychopathology, and resilience are highlighted.

Research on adolescence has burgeoned over the course of the past several decades. Testimony to the growing interest in the period of adolescence is provided through an examination of the table of contents in the *Annual Review of Psychology* volumes. Although the first article in this publication devoted exclusively to adolescence did not appear until the 38th volume (Petersen, 1988), since 1995, reviews of adolescence have appeared every 3 years (Coropus, Hindon, & Gerhardt, 1995; Lerner & Galambos, 1998; Steinberg & Morris, 2001). In addition, investigations on adolescence and normative development, as well as work on adolescence and psychopathology, have increased greatly in the scientific literature. Despite these advances, there remains a relative paucity of published research addressing adolescence, development, and psychopathology.

In view of the risks facing adolescents attributable to biological and psychological developmental changes, as well as to more external social and situational challenges they must confront, it is not surprising that the study of adolescent development holds much promise for advancing many of the goals embodied by a developmental psychopathology perspective. A number of issues that have been examined by investigators of adolescent development mirror areas of interest to developmental psychopathologists. These include (a) the use of interdisciplinary models of development, (b) issues related to the continuity or discontinuity of de-

velopment across the life course, (c) the boundary and linkages between normal and maladaptive or pathological functioning, (d) the transactions that occur between environmental and more person-specific characteristics, (e) processes associated with risk and resilience, and (f) the integration of basic research into the design and provision of prevention and intervention.

Adolescence is a particularly compelling period of development and one that lends itself to investigations guided by a developmental psychopathology perspective. Biological, psychological, and social systems undergo marked developmental changes during adolescence (Feldman & Elliott, 1990; Spear, 2000a, 2000b). Building on the normative advances accompanying adolescence, research conceived within a developmental psychopathology framework not only can inform knowledge of adolescent psychopathology but also can contribute to an enhanced understanding of developmental processes more generally (Cicchetti, 1984; Cicchetti & Cohen, 1995c; Sroufe, 1990). Over the life course, adolescence is characterized by a rather lengthy transition phase in which the individual is neither a child nor an adult. Although the adolescent strives to move toward acquiring independence and the attainment of the perceived rewards of adulthood, parents and social institutions, recognizing the adolescent's relative lack of preparedness for the assumption of full adult responsibilities, struggle with relinquishing their perceptions of the adolescent as a child. Consequently, the flux and renegotiation inherent in this developmental period increase the potential for both internal and external conflict. Concomitantly, however, opportunities for growth and the realization of new possibilities occur (Cicchetti & Toth, 1996).

Adolescence has in the past been characterized as a period of "storm and stress" (Hall, 1904), and the extreme problems in adjustment exhibited by a few were generalized as normative experiences for all adolescents (Freud, 1958). However, the storm and stress of adolescence is neither universal nor inevitable. Most adolescents cope successfully with the developmental demands of this period and do not evidence extremes of maladaptation. Nev-
