Applied Hyperfunction Theory:

Applied Hyperfunction Theory Isao Imai, 2013-03-09 Generalized functions are now widely recognized as important mathematical tools for engineers and physicists But they are considered to be inaccessible for non specialists To remedy this situation this book gives an intelligible exposition of generalized functions based on Sato's hyperfunction which is essentially the boundary value of analytic functions An intuitive image hyperfunction vortex layer is adopted and only an elementary knowledge of complex function theory is assumed The treatment is entirely self contained The first part of the book gives a detailed account of fundamental operations such as the four arithmetical operations applicable to hyperfunctions namely differentiation integration and convolution as well as Fourier transform Fourier series are seen to be nothing but periodic hyperfunctions In the second part based on the general theory the Hilbert transform and Poisson Schwarz integral formula are treated and their application to integral equations is studied A great number of formulas obtained in the course of treatment are summarized as tables in the appendix In particular those concerning convolution the Hilbert transform and Fourier transform contain much new material For mathematicians mathematical physicists and engineers whose work involves generalized functions Journal of Mathematics, 2001 **Journal of Mathematics** Tokushima Daigaku, 2001

Distortion Theorems in Relation to Linear Integral Operators Yūsaku Komatsu, 1996 Details 20 years of research on distortions of functionals under actions of linear integral operators Part I addresses linear integral operators and their properties Part II develops several different kinds of distortions under actions of integral operators for various familiar functionals Specific subjects include distortions on the class of univalent functions and its subclasses Caratheodory and distortions by a differential operator For researchers and graduate students involved in complex analysis integral transforms operational calculus and operator theory Annotation copyrighted by Book News Inc Portland OR **Journal of the Physical Society of Japan**, 2006 **Applications of Mathematics in Mechanics** Bogoljub Stanković, 2006 *Journal of analysis and its application*, 2002 **Ramified Integrals, Singularities and Lacunas** V.A. Kuzhel, 1996 This

work aims to give a systematic presentation of methods used in the spectral theory of nonself adjoint generally unbounded operators. Subjects treated include the wide class of both selfadjoint and nonself adjoint extensions of Hermitian operators, characteristic functions of a regular extension, the construction of some operator models for different classes of nonself adjoint operators, the construction of the selfadjoint dilation of an arbitrary dissipative operator and J unitary and J selfadjoint dilations of linear operators, the abstract Lax Phillips scheme in scattering theory for spaces with indefinite metric Pontryagin spaces, the relation between scattering matrix and the characteristic function of J nonexpansive operators, a structure of J nonexpansive operators and contractions and their triangulation.
