Massive WDM and TDM Soliton Transmission Systems Akira Hasegawa, 2006-04-11 This book summarizes the proceedings of the invited talks presented at the International Symposium on Massive TDM and WDM Optical Soliton Transmission Systems held in Kyoto during November 9-12 1999 The symposium is the third of the series organized by Research Group for Optical Soliton Communications ROSC chaired by Akira Hasegawa The research group ROSC was established in Japan in April 1995 with a support of the Japanese Ministry of Post and Telecommunications to promote collaboration and information exchange among communication service companies communication industries and academic circles in the theory and application of optical solitons The symposium attracted enthusiastic response from worldwide researchers in the field of soliton based communications and intensive discussions were made In the symposium held in 1997 new concept of soliton transmission based on dispersion management of optical fibers were presented This new soliton is now called the dispersion managed soliton The present symposium mainly focuses the theoretical and experimental developments of dispersion managed solitons It is remarkable that the concept of the dispersion managed soliton which was just born two years ago when the naming was not even given yet has become the center of soliton research in two years The dispersion managed soliton has an enhanced power in maintaining reasonable signal to noise ratio yet has reduced Gordon Haus timing jitter by reduced averagedispersion The dispersion managed soliton also has demonstrated its power in soliton based WDM transmissions *Progress in Optics*, 2002-12-11 This volume contains five articles presenting reviews of several topics of current research which are likely to be of interest to optical scientists and optical engineers The first article by J Ohtsubo deals with the dynamics of feedback induced instability and chaos The characteristics of semiconductor lasers based on the rate equations including various laser structures are reviewed and the effects of optical feedback in semiconductor lasers are then discussed the general area of the nonlinear interaction of ultrafast pulses with optical and photonic crystal fibres are discussed In particular ultrafast pulse measurements pulse shaping and pulse control are discussed transient optical phenomena that take place in the spatial temporal dynamics of ultrashort pulses The interplay of diffractive and dispersive phenomena is examined They include coupled processes of amplitude and phase reshaping spectral variations and polarity reversal for different types of light pulses Reflection and refraction effects that take place at the interface between media with time dependent dielectric susceptibilities are also discussed principles of optical coherence tomography OCT This is a relatively new discipline with important potential applications in macroscopic microscopic and endoscopic imaging The

article begins with a brief summary of the field and then describes various OCT interferometer configurations and discusses basic sample signal extraction techniques The article also covers subjects such as contrast generation techniques resolution signal processing techniques for image display image enhancement speckle suppression and OCT detection sensitivity A description of optical delay lines used in OCT is also presented concerned with modulation instability MI of electromagnetic waves in inhomogeneous and in discrete media The article pays special attention to the MI of electromagnetic waves in nonlinear optical fibres with periodic amplification dispersion and birefringence The MI in random media is also covered Other topics discussed in this article are discrete nonlinear systems with cubic quadratic and vectorial interactions and nonlinear optical systems such as tunnel coupled filters Some of the readers may note that authors from six different countries have contributed to this volume thus helping to maintain the international character of this series
