Procedures for determining the result of a change in inputs to a system simulation The study discusses the reliability of an experimental result and describes methods of estimating it The method recommended uses a single replication and makes use of the covariance stationarity of the underlying stochastic process The comparative reliability of results for different experiments is also discussed For comparing experiments it is suggested that reliability based on equal ratios is often preferable A procedure for graphical analysis is presented including a list of transformations of the dependent variable that help to reveal the correct form of the relationship between input and output The generalized least squares method for estimating the parameters of the identified form takes into consideration the varying reliabilities of the different results and leads to more efficient estimates than those obtained by the unweighted least squares method A procedure is given for predicting the computer time needed for a given input and a specified reliability Author
