Dynamics Of Star Clusters:

Dynamics of Young Star Clusters and Associations Cathie Clarke, Robert D. Mathieu, Iain Neill Reid, 2015-09-11

Where do most stars and the planetary systems that surround them in the Milky Way form? What determines whether a young star cluster remains bound such as an open or globular cluster or disperses to join the field stars in the disc of the Galaxy? These questions not only impact understanding of the origins of stars and planetary systems like our own and the potential for life to emerge that they represent but also galaxy formation and evolution and ultimately the story of star formation over cosmic time in the Universe. This volume will help readers understand our current views concerning the answers to these questions as well as frame new questions that will be answered by the European Space Agency's Gaia satellite that was launched in late 2013. The book contains the elaborated notes of lectures given at the 42nd Saas Fee Advanced Course Dynamics of Young Star Clusters Associations by Cathie Clarke, University of Cambridge who presents the theory of star formation and dynamical evolution of stellar systems; Robert Mathieu, University of Wisconsin who discusses the kinematics of star clusters and associations; and I Neill Reid, Space Telescope Science Institute who provides an overview of the stellar populations in the Milky Way and speculates on from whence came the Sun. As part of the Saas Fee Advanced Course Series, the book offers an in-depth introduction to the field serving as a starting point for Ph.D. research and as a reference work for professional astrophysicists.

The emphasis in these proceedings of IAD Symposium No 113 Dynamics of Star Clusters and Le mab rPIHlon for orZ lnizingp thE symposium in the spring of 1984 was the rapid increase during the preceding year in our understanding of core collapse. The last I A D Symposium to discuss the dynamics of star clusters at length was No 69 Dynamics of Stellar Systems held in Besan on in 1974. For a few years afterwards globular clusters received much attention due to the discovery of X-ray bursters and the mounting evidence that X-ray sources in globular clusters were formed in completely different ways than those within our galaxy. Globular clusters which until this time had a reputation for sedate old age turned out to lead violent private lives at high energies. However in the early 80s globular clusters seemed to lose some of the glamor of the 70s. The grand speculations of heavy black holes lurking in their centers had to make way for a variety of observational evidence which indicated that the X-ray sources are low mass close binaries instead. But though dynamical fashion turned to heavy galactic halos and so on some of the unsolved theoretical problems regarding the evolution of star clusters kept their fascination for a number of relatively isolated workers. After several years of inconspicuous labor a number of preprints suddenly appeared in the spring of 1983 that studied the evolution of globular clusters after core collapse.

Haas,2014-01-18 In this PhD thesis which was nominated for publication in this series by the Astronomical Institute at Charles University Prague the author investigates the orbital evolution of an initially thin stellar disc around a supermassive black hole considering various perturbative sources of gravity His findings obtained by both direct numerical N body modelling and using standard perturbation methods offer a viable theoretical explanation for the observed configuration of young stars in the Galactic Centre This marks a significant contribution to a topic of great interest in contemporary astrophysics The author also shows in his thesis that a secular instability m 1 mode may occur in the embedding spherical cluster of old stars This increases the richness of possible evolution scenarios of the embedding cluster and may lead to effective feeding of supermassive black holes through tidal disruption of stars on extremely eccentric orbits **The**
