both here. To clarify the experiments, however, it seems useful to indicate briefly the common principles of driving that are applicable to all types of pair harness.

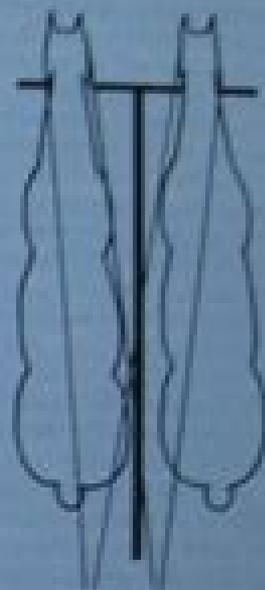

Driving a paired team requires that a single action of the hand indicates simultaneously to both horses any change of direction. This is achieved by the crossing of the inside reins, which allows them to act on the left or on the right sides of both horses at the same time, whether the reins are caught or not (see fig. "reins"). The precise transmission of the rein aids, from the hand of the driver to the mouth of the horse, is facilitated by passing the reins through levers, which also helps to keep them in place at a trot, preventing them from looping and falling to the ground.

The technique of driving can only be learned by practice. It consists in knowing how to obtain the maximum efficiency from a team, while sparing the horses as far as possible. A subtle play of the hands should keep a soft contact with the mouths of the horses through the reins,

intervening only with precision and at the right moment. The gait should be regulated and varied according to the terrain and the driver should know how to "place the wheels", following the irregularities in the ground, negotiating differences of level at right angles to the direction of travel, "one wheel after the other". The "sense of pace" should be preserved under all circumstances by a judicious knowledge of the pull, which varies according to the terrain and which implies appropriate changes of gait. Driving is a difficult skill; there are good and bad drivers, and one can only speak of it from practical experience.

A METHOD OF RESEARCH

It is necessary to describe the method used to make and experiment with different types of obsolete harness, taking into consideration the technical data that has a bearing on it.
