

Is biochemical resource quality for herbivorous consumers enhanced by the manipulation of light and nutrient regimes?

M. Villar-Argaiz, Juan M. Medina-Sánchez, Francisco J. Ballejos, José A. Delgado and Presentación Carrillo

Introduction

Light and nutrients are among the most important variables affecting species and food web interactions (ULAN & STRONG 1996). Herbivore growth is regulated by the effects of light and nutrients on the quantity and quality of available resources, yet the role of ultraviolet radiation (UVR) in combination with other potential stressors has been neglected. A number of studies have shown that UVR affects essential fatty acids in plants (LIU et al. 2006), which in turn might affect plant-animal interactions (PAUL & GWYNNE-JONES 2005). While there is consistent evidence that UVR decreases C:P ratios in algae (XISEROGILOS et al. 2002, P. Carrillo pers. comm.), the effect of UVR on the quality (fatty acid composition) of algae remains unknown. Some studies reported a decrease in polyunsaturated fatty acids (PUFAs) under UVR (GOSS et al. 1994), whereas others show no influence or an increase in certain types of PUFA in response to UVR (LIU et al. 2006). Effects of solar radiation on organisms were also reported to be related to the availability of limiting mineral nutrients (MEDINA-SÁNCHEZ et al. 2002). With this background, our aim was to elucidate the joint role of UV radiation and nutrient enrichment in the fatty acid composition of primary producers, using large experimental mesocosms in a high mountain lake.

Key words: essential fatty acids, high mountain lakes, light and nutrient interaction, ultraviolet radiation

Materials and methods

Experimental set-up

Experiments were performed from August to October 2003 in lake La Caldera, an oligotrophic high mountain lake located in Sierra Nevada, Southern Spain (36°55'–37°15'N, 2°31'–3°40'W). Lake water was pumped from 5-m depth into 10 polyethylene enclosures, each with diameter of 1 m, depth of 7 m and volume of 2.7 m³. Five of the enclosures had polyethylene tops to receive natural solar radiation (+UV treatment), and the other 5 were covered with Plexiglas UF3 sheets that

completely blocked direct and refractory exposure to UV radiation (–UV treatment). In both series of enclosures, phosphate (NaH₂PO₄) was added to create an increasing nutrient gradient of 4 concentrations (20, 30, 40, and 60 µgP L⁻¹), and inorganic nitrogen (NH₄NO₃) was added to give a final N:P molar ratio of 30, in accordance with concentrations of inorganic nutrients (NO₂⁻, NO₃⁻, NH₄⁺, and soluble reactive phosphate, SRP) measured in the lake the day before the experiment. For each light treatment, 1 enclosure received no phosphate and served as a control to give a 2 (light) × 5 (nutrient) factorial design with 1 replicate. After 5 weeks of incubation, enclosures were sampled 3 times every 2 days for biochemical determinations, using a plastic bucket after gently mixing the entire length of the enclosure.

Fatty acid analysis

Fatty acids in seston were analyzed after extraction and methylation (MASON & WALLER 1964) using a gas chromatograph (Finnigan MAT GCQ) equipped with a programmable temperature vaporizer-injector and a fused-silica DB-225MS capillary column (J&W Scientific) and a flame ionization detector. Units for fatty acids in this study are µg per mg of carbon in seston.

Data analysis

We specifically normalized seston fatty acid content with the intention of quantifying the effects of nutrient and UVR × nutrient manipulations. Nutrient normalization was calculated by dividing each fatty acid replicate of each nutrient treatment by the mean of control replicates (with no nutrients) in +UVR enclosures. UVR normalization was calculated by dividing each +UVR replicate by the mean of –UVR replicates for each nutrient level. The significance of nutrients and UVR × nutrients effects on normalized seston fatty acids were then analysed by regression analysis (Table 1). Data were checked regression analysis criteria. When regressions were not significant, differences between UVR treatments or between each P-enriched
