

2. Horizontal development:

It is useful with adhering thin layers and loss layers. The sample is placed in the centre of the plate and developed either by slowly dripping solvent on it from micropipette. This procedure is also called circular TLC.

3. Multiple developments:

In this the development is carried repeatedly with same solvent in same direction each time after drying.

4. Stepwise development:

It is carried out consecutively with two different solvents but in same direction. One of the solvents is run to a height of 15 – 18 cm and the other to 10 – 12 cm.

5. Gradient development:

Sometimes it is advantageous especially when fractionating compounds of widely different properties change the composition of the solvent continuously during chromatography. This technique is called gradient elution. In this technique the chromatoplate is lowered into a jar containing a solvent and then a second more polar solvent is added in chamber with help of burette. The elute is continuously stirred. As a result polarity of the former solvent polarity of the former solvent is modified by second solvent.

6. Continuous development:

When there are small differences in R_F values, the development distance is increased in order to achieve complete separation. This is done by continuous development in which a solvent is forced to run over the edges of the chromatoplates. Where it can be collected instead of being left to evaporate.

7. Two dimensional development:

It is also possible to develop the square plates in two dimensions. A sample is spotted in a corner of the plate and then developed consecutively, in two directions either with two same solvent or different solvents.

The location of compound after development is dire by spraying different developing reagents. If substance shows dark spots against a florescent background they can be made visible under a U.V. lamp.
