Diagnostic Imaging In Medicine:

Radiology in Global Health Daniel J. Mollura, Matthew P. Lungren, 2014-07-02 The World Health Organization stated that approximately two thirds of the world's population lacks adequate access to medical imaging. The scarcity of imaging services in developing regions contributes to a widening disparity of health care and limits global public health programs that require imaging. Radiology is an important component of many global health programs including those that address tuberculosis, AIDS related disease, trauma, occupational and environmental exposures, breast cancer screening and maternal infant health care. There is a growing need for medical imaging in global health efforts and humanitarian outreach particularly as an increasing number of academic, government and non governmental organizations expand delivery of health care to disadvantaged people worldwide. To systematically deploy clinical imaging services to low resource settings requires contributions from a variety of disciplines such as clinical radiology, epidemiology, public health, finance, radiation physics, information technology, engineering and others. This book will review critical concepts for those interested in managing, establishing or participating in a medical imaging program for resource limited environments and diverse cross cultural contexts undergoing imaging technology adaptation.

Diagnostic Imaging in Medicine Richard C. Reba, David J. Goodenough, H.F. Davidson, 2012-12-06 An Advanced Study Institute on Ultrasonics in Medical Diagnosis was held in Milan, Italy from 10 to 15 June 1974. This ASI was of a short five day duration and limited to cardiac diagnosis by ultrasound only. Since that time the field of diagnostic imaging in medicine has literally exploded with new and improved means of medical diagnosis such as computed tomography, microwaves, nuclear magnetic resonance and other sophisticated techniques. These developments have enabled medical practitioners to make diagnoses with a minimum of danger to the patient and a maximum of accuracy never before possible and represent a multi quantum advance over the early state of the art presented at the 1974 ASI. Since then several meetings have taken place on these individual topics to bring together experts who presented their latest research results but none have discussed the entire field of diagnostic imaging in medicine in one meeting nor have they had the teaching character of an Advanced Study Institute. The art and science of medicine have been altered repeatedly during the eight year interval since the last ASI. Today's clinician must be part technologist and must be enough of an investigator to understand and appreciate the scientific method. The current complex advances in instrumentation and pharmacology have had a marked effect on how medicine is practiced. There was therefore an urgent need to bring the entire field of imaging in medicine to one teaching podium where the many advances of the last six or seven years could be reviewed.
