Imaging of the Brain in Psychiatry and Related Fields Konrad Maurer, 1993 In the last two decades imaging of the brain or neuroimaging has become an integral part of clinical and research psychiatry This is due to recent advances in computer technology which has made it relatively easy to generate brain images representing structure and function of the central nervous system Currently used clinical diagnostic imaging modalities such as X ray computed tomography CT and magnetic resonance imaging MRI provide

predominantly anatomic information CT images reflect X ray attenuation distribution within the brain whereas MRI signals depend primarily on proton sensitivity and tissue relaxivity The chapter Structural Imaging Methods reviews CT and MRI studies on schizophrenic and affective disorders and degenerative central nervous system diseases The impact of fast three dimensional 3 0 imaging and the automatic transfer from 3 D elements in the brain to artificial diagrams based on this information is considered Since the original report of the findings of Ingvar and Franzen in 1974 and the introduction of regional cerebral blood flow rCBF measurements single photon emission computed tomography SPECT has been gaining acceptance as one of the major imaging techniques and it is available in most nuclear medicine departments The section Functional Imaging Methods Cerebral Blood Flow CBF Single Photon Emission Computerized Tomography SPECT describes rCBF studies with the ¹³³Xe inhalation method utilizing a 254 detector system and rCBF images measured by SPECT using the tracer ^{99m}Tc HMPAO
