Genes in Development Eva M. Neumann-Held,Christoph Rehmann-Sutter,2006 In light of scientific advances such as genomics predictive diagnostics genetically engineered agriculture nuclear transfer cloning and the manipulation of stem cells the idea that genes carry predetermined molecular programs or blueprints is pervasive Yet new scientific discoveries such as rna transcripts of single genes that can lead to the production of different compounds from the same pieces of dna challenge the concept of the gene alone as the dominant factor in biological development Increasingly aware of the tension between certain empirical results and interpretations of those results based on the orthodox view of genetic determinism a growing number of scientists urge a rethinking of what a gene is and how it works In this collection a group of internationally renowned scientists present some prominent alternative approaches to understanding the role of dna in the construction and function of biological organisms Contributors discuss alternatives to the programmatic view of dna including the developmental systems approach methodical culturalism the molecular process concept of the gene the hermeneutic theory of description and process structuralist biology None of the approaches cast doubt on the notion that dna is tremendously important to biological life on earth rather contributors examine different ideas of how dna should be represented evaluated and explained Just as ideas about genetic codes have reached far beyond the realm of science the reconceptualizations of genetic theory in this volume have broad implications for ethics philosophy and the social sciences Contributors Thomas B rglin Brian C Goodwin James Griesemer Paul Griffiths Jesper Hoffmeyer Evelyn Fox Keller Gerd B M ller Eva M Neumann Held Stuart A Newman Susan Oyama Christoph Rehmann Sutter Sahotra Sarkar Jackie Leach Scully Gerry Webster Ulrich Wolf **Genetic Analysis of Animal Development** Adam S. Ruddle, 2013-09-17 Genetic Mechanisms of Development is a compilation of articles that surveys the application of genetic systems of analysis to the resolution of fundamental problems in developmental biology The book is composed of sections that deal with various aspects of genetic mechanisms The first section tackles the genetic analysis of gene regulation in microorganisms The second section discusses the application of Mendelian genetics to the study of the development of Drosophila amphibians and the laboratory mouse The last section introduces somatic cell genetics a tool for developmental biologists Biologists geneticists zoologists and researchers will find the book a good source of information

Developmental Genetics of the Pharyngeal Arch System Jeffry M. Cesario, André Landin Malt, Juhee Jeong, 2015-05-01 The pharyngeal arches are embryonic structures that develop into the face neck a part of the heart and several endocrine glands in animals They are thought to have played a key role in vertebrate evolution as their derivatives impact the mode of feeding and breathing Moreover perturbation in pharyngeal arch development is associated with several major groups of birth defects in humans During early embryonic development cells from all three germ layers come together to assemble the pharyngeal arches Subsequently the pharyngeal arches undergo growth morphogenesis and cell type differentiation to give rise to musculoskeletal cardiovascular neural and glandular components These processes are guided by interactions amongst different tissues via signaling molecules A large number of genes with a complex network of regulatory relationships govern each aspect of pharyngeal arch development With the advance of molecular genetics tools in model organisms such as mice we are beginning to understand the molecular and cellular mechanisms underlying development of the pharyngeal arches and related birth defects This eBook will provide an introduction into development of the pharyngeal arch system with a detailed discussion on the genetic regulation of this process
