## **Developmental Neuropathology:**

**Developmental Neuropathology** Reinhard L. Friede, 2012-12-06 The present text was envisioned as a supplement to existing texts on human neuropathology covering only those aspects of pediatric neuropathology which pertain to and are peculiar of the immature nervous system No coverage or only brief comment is given to diseases commonly found in adults which may on occasion occur in childhood or infancy as well The subject matter is divided into three main categories 1 The acquired lesions dating to the fetal perinatal or early postnatal periods 2 the malformations and 3 the heritable metabolic defects The first 6 chapters 2 7 are reserved to the lesions most intimately linked to the circumstances of birth There is some inherent ambiguity in distinguishing between acquired lesions and malformations as indeed no sharp distinction can be made between one and the other Many malformations result from diseases acquired during fetal life and their peculiarity resides in the fact that the organ becomes affected before its development terminates and in such a way that its subsequent development becomes deranged or partly abrogated A variety of causes acting at the same developmental period or over a common pathogenetic mechanism may produce the same type of derangement including chemical physical infectious or genetic factors as pointed out repeatedly in the text Consequently the definition of a malformation as differing from an acquired residual lesion was made dependant on evidence for the derangement of developmental processes subsequent to the acquisition of the disease

**Developmental Neuropathology of Schizophrenia** Sarnoff A.

Mednick, Tyrone D. Cannon, Christopher E. Barr, Jose M. LaFosse, 2012-12-06 This volume reports the proceedings of a NATO Advanced Workshop held in Castelvecchio Pas coli Italy from August 28 September 1 1989 An important inspiration for this Workshop came from our studies in Helsinki and Denmark which have found that exposure to an influenza epidemic during the second trimester of fetal development increases the risk of adult schizophrenia This finding has stimulated an important new hypothesis in the study of the etiology of schizophrenia It has suggested the possibility that disturbances of brain development during gestation may contribute to the risk of adult schizophrenia We determined that it would be of value to bring together schizophrenia researchers and those doing basic studies of the development of the brain Both groups of researchers were encouraged to communicate at a level that would help other scientists to integrate their knowledge and techniques into their own discipline For this reason perhaps the papers of this volume are remarkably clear and not difficult to understand The first four chapters describe the neurochemical and structural aspects of brain development The chapter by Dziegielewska and Saunders discusses transport mechanisms and the properties of endogenous and exogenous substances that control the internal environment of the developing brain In the second chapter Nowakowski reports on his studies of the development of the hippocampus in mice genetically inbred to exhibit disruptions of neural migration
