Phuong-Chi T. Pham, 2019-04. Kidney transplantation has become a routine therapeutic option for patients with end-stage kidney disease globally. Over 16,000 to 19,000 kidney transplants are performed annually in the United States. While transplant nephrologists care for transplant recipients and living donors in the perioperative period, general nephrologists are expected to care for these patients after three months following their transplants. The management of immunosuppressive therapy and complications associated with the transplant process is complex and requires an in-depth knowledge of transplant medications, drug interactions, both acute and long-term complications, among many other transplant and non-transplant related problems. Selection and referral of potential living donors are other processes that are vital to kidney transplantation and require the involvement of general nephrologists. Most general nephrologists, however, are not well trained in kidney transplantation and/or do not care for enough kidney transplant patients to gain adequate experience to provide patients with the best possible care. Current Issues and Future Direction in Kidney Transplantation

Thomas Rath, 2013-02-13. The here-presented book covers different areas of clinical and scientific interest, reaching from donor evaluation to newest methods in immunological diagnostics. But also aspects of daily care of transplant recipients can be found in the carefully selected chapters. Everything driven by the aim to improve the care for all of our transplanted patients.
