Dickinson, 1970 Crystals of high chemical and mechanical perfection are required for research in electronic devices The purpose of the research reported here was to produce diamonds for use in the fabrication of semiconducting devices This was one portion of a laboratory wide program investigating the utilization of diamond as a high temperature semiconductor Diamond synthesis is explained in terms of crystallization from a super saturated liquid The major driving force is thermodynamic The primary condition for synthesis is a stable diamond liquid equilibrium in which the liquid is composed of carbon and certain metal solvents Thermodynamic expressions are developed for describing the pertinent portions of the nickel cobalt manganese and iron carbon binary systems Temperature composition diagrams at high

pressures are drawn to show stability relationships and the allowed limits for synthesis The theoretical model is verified by an extensive ultrahigh pressure temperature experimental investigation Theoretical and empirical results are employed in predicting conditions for producing high quality single crystals Author *A Mathematical Model For The Diamond Synthesis Process* Vandeput Fernand Rene,1989 **Diamond**, Gordon Davies,1984-06 [Diamond Synthesis](#) Mark Yung-Kang Chang,1972 **Diamond** Lincoln Laboratory.
