When multiple forces act on an object, they combine to produce a net force, which determines whether the object speeds up, slows down, or changes direction. Understanding how forces act together is essential to explaining many phenomena, from a ball's path during a baseball game to a rocket's trajectory in space.</p> <p>Newton's second law of motion states that the acceleration of an object is directly proportional to the net force acting on it and inversely proportional to its mass. This means that if the net force increases, the acceleration increases proportionally, but if the mass also increases, the acceleration will decrease. For example, pushing a heavy box with a small force will result in a small acceleration, while pushing a lighter box with the same force will result in a larger acceleration.</p> <p>Friction is a contact force that opposes the direction of motion. It acts between two surfaces in contact, whether they are solid, liquid, or gas. Friction is caused by the roughness of surfaces and the molecular forces between them. It is essential for many everyday activities, such as walking, driving, and holding objects. Without friction, objects would slide across surfaces without any resistance, making it impossible to walk or drive. Friction also plays a role in slowing down moving objects, such as a ball rolling on a surface or a car braking on a road.</p> </div> <p>Answer the correct answer for each question.</p> <ol style="list-style-type: none"> Which of the following is not a contact force? <ul style="list-style-type: none"> a.
