X-ray and Gamma-ray Detectors and Applications IV Ralph B. James,2002 We are developing 10 mm thick CZT detectors with 3-D readout for 100 keV to 1.5 MeV gamma rays Multiple site gamma ray interactions are fully measured i.e. the energy and 3-D position of each site are determined Spatial resolution is 1 mm FWHM Anode pixel readout with 1 mm pitch is used for x and y positions and charge drift times for z positions Drift time measurements are triggered by the cathode signal and end when each interaction site's

charge cloud reaches an anode pixel Post event processing corrects for signal loss due to charge trapping and accurately determines gamma ray energies with a goal of 1% energy resolution at 662 keV Compton kinematic analysis can identify the initial interaction site in most cases as well as constrain the incident gamma ray direction Tests were made with a prototype detector measuring 10 x 10 x 10 mm³ and operated at 1000 V bias The measured drift time resolution of 25 nsec FWHM at 662 keV and 60 nsec at 122 keV corresponds to z position resolution of 0.25 and 0.60 mm FWHM respectively The technique is described and results of modeling and tests are presented *The New Book of Popular Science: Earth sciences, energy, environmental sciences*, 2004 **Gamma-Ray Burst and Afterglow Astronomy 2001** G.R.
