Fundamental Tests of Physics with Optically Trapped Microspheres Tongcang Li,2012-11-02 Fundamental Tests of Physics with Optically Trapped Microspheres details experiments on studying the Brownian motion of an optically trapped microsphere with ultrahigh resolution and the cooling of its motion towards the quantum ground state Glass microspheres were trapped in water air and vacuum with optical tweezers and a detection system that can monitor the position of a trapped microsphere with Angstrom spatial resolution and microsecond temporal resolution was developed to study the Brownian motion of a trapped microsphere in air over a wide range of pressures The instantaneous velocity of a Brownian particle in particular was studied for the very first time and the results provide direct verification of the Maxwell Boltzmann velocity distribution and the energy equipartition theorem for a Brownian particle For short time scales the ballistic regime of Brownian motion is observed in contrast to the usual diffusive regime In vacuum active feedback is used to cool the center of mass motion of an optically trapped microsphere from room temperature to a minimum temperature of about 1.5 mK This is an important step toward studying the quantum behaviors of a macroscopic particle trapped in vacuum

Innovations in Fishing Technology Aimed at Achieving Sustainable Fishing Alessandro Lucchetti, Valentina Melli, Jure Brčić, 2023-11-20 Over the last fifty years human exploitation of marine resources has become more efficient as the understanding of the habits and behaviour of the various species available in the sea gradually increased Thus technologies have developed naturally over time and fishing gears and practices have become more sophisticated These technical advances in fishing gear have generally led to more efficient economic fishing operations and better access to resources However fishing implies the harvesting of marine organisms directly from their natural environment therefore general awareness of environmental problems due to the exploitation of fishery resources has also increased In particular the poor selectivity of some gears is responsible for the capture of juveniles immature and undersized specimens of many species with negative consequences on the state of stocks In addition bycatch in marine fisheries is a major source of human caused mortality of marine megafauna often leading to the capture of vulnerable species Finally many

bottom towed gears are responsible for high impacts on bottom communities and habitats with cascading consequences on the entire marine ecosystem All these impacts can lead to changes in the structure function and integrity of ecosystems including effects on the food webs and multispecies predator prey relationships **Report of Investigations** ,1966
