A car changing direction at a sharp turn. A car slowing down to a stop. Which force does NOT always affect the acceleration of an object? <ol style="list-style-type: none"> The normal force. When multiple forces act on an object, they combine to produce a net force, which determines whether the object speeds up, slows down, or changes direction. Understanding how forces act together is essential to explaining many phenomena, from a ball's path during a baseball game to a rocket's trajectory in space.</p> <p>Newton's second law of motion states that the acceleration of an object is directly proportional to the net force acting on it and inversely proportional to its mass. This means that if the net force increases, the acceleration increases proportionally, but if the mass also increases, the acceleration will decrease. For example, pushing a heavy box with a small force will result in a small acceleration, while pushing a lighter box with the same force will result in a larger acceleration.</p> <p>Friction is a force that opposes motion between two surfaces in contact. It acts in the opposite direction of the object's motion, slowing it down or preventing it from moving at all. Friction is caused by the roughness of the surfaces and the forces between the molecules of the two surfaces. Friction is essential for many everyday activities, such as walking, driving, and holding objects. Without friction, the world would be a very different place.</p> </div> <p>Answer the questions that follow.</p> <ol style="list-style-type: none"> What does Newton's second law of motion state? <ol style="list-style-type: none"> Acceleration is directly proportional to force and inversely proportional to mass.
