Boolean Methods In Operations Research And Related Areas:

Boolean Methods in Operations Research and Related Areas P. L. Hammer, S. Rudeanu, 2012-12-06 In classical analysis there is a vast difference between the class of problems that may be handled by means of the methods of calculus and the class of problems requiring combinatorial techniques With the advent of the digital computer the distinction begins to blur and with the increasing emphasis on problems involving optimization over structures the distinction vanishes What is necessary for the analytic and computational treatment of significant questions arising in modern control theory mathematical economics scheduling theory operations research bioengineering and so forth is a new and more flexible mathematical theory which subsumes both the classical continuous and discrete algorithms The work by HAMMER IVANESCU and RUDEANU on Boolean methods represents an important step in this direction and it is thus a great pleasure to welcome it into print It will certainly stimulate a great deal of additional research in both theory and application RICHARD BELLMAN University of Southern California FO of WOI

Boolean methods in operations research and related areas Peter L. Hammer, 1986 Boolean Functions Yves Crama, Peter L. Hammer, 2011-05-16 Written by prominent experts in the field this monograph provides the first comprehensive unified presentation of the structural algorithmic and applied aspects of the theory of Boolean functions The book focuses on algebraic representations of Boolean functions especially disjunctive and conjunctive normal form representations This framework looks at the fundamental elements of the theory Boolean equations and satisfiability problems prime implicants and associated short representations dualization an in depth study of special classes of Boolean functions quadratic Horn shellable regular threshold read once functions and their characterization by functional equations and two fruitful generalizations of the concept of Boolean functions partially defined functions and pseudo Boolean functions Several topics are presented here in book form for the first time Because of the depth and breadth and its emphasis on algorithms and applications this monograph will have special appeal for researchers and graduate students in discrete mathematics operations research computer science engineering and economics

Topics in Signal Processing Suhash Chandra Dutta Roy, 2019-10-11 This book is a collection of specific research problems in signal processing and their solutions It touches upon most core topics including active and passive processing discrete time and continuous signals and design of filters and networks for specific applications This unique collection of design problems and conceptual insights will be useful to graduate students researchers and professionals working on signal processing problems In addition the book can also be used as a supplementary text for graduate courses in advanced signal processing and for professional development courses for practicing engineers

Handbook of Satisfiability Armin Biere, Hans van Maaren, Toby Walsh, 2009-01-15 Satisfiability SAT related topics have attracted researchers from various disciplines logic applied areas such as planning scheduling operations research and combinatorial optimization but also theoretical issues on the theme of complexity and much more they all are connected through SAT My personal interest in SAT stems from actual

solving The increase in power of modern SAT solvers over the past 15 years has been phenomenal It has become the key enabling technology in automated verification of both computer hardware and software Bounded Model Checking BMC of computer hardware is now probably the most widely used model checking technique The counterexamples that it finds are just satisfying instances of a Boolean formula obtained by unwinding to some fixed depth a sequential circuit and its specification in linear temporal logic Extending model checking to software verification is a much more difficult problem on the frontier of current research One promising approach for languages like C with finite word length integers is to use the same idea as in BMC but with a decision procedure for the theory of bit vectors instead of SAT All decision procedures for bit vectors that I am familiar with ultimately make use of a fast SAT solver to handle complex formulas Decision procedures for more complicated theories like linear real and integer arithmetic are also used in program verification Most of them use powerful SAT solvers in an essential way Clearly efficient SAT solving is a key technology for 21st century computer science I expect this collection of papers on all theoretical and practical aspects of SAT solving will be extremely useful to both students and researchers and will lead to many further advances in the field Edmund Clarke FORE Systems University Professor of Computer Science and Professor of Electrical and Computer Engineering at Carnegie Mellon University winner of the 2007 A M Turing Award

Nonlinear Integer Programming Duan Li,Xiaoling Sun,2006-08-13 It is not an exaggeration that much of what people devote in their hfe re solves around optimization in one way or another On one hand many decision making problems in real applications naturally result in optimization problems in a form of integer programming On the other hand integer programming has been one of the great challenges for the optimization research community for many years due to its computational difficulties Exponential growth in its computational complexity with respect to the problem dimension Since the pioneering work of R Gomory 80 in the late 1950s the theoretical and methodological development of integer programming has grown by leaps and bounds mainly focusing on linear integer programming The past few years have also witnessed certain promising theoretical and methodological achieve ments in nonlinear integer programming When the first author of this book was working on duality theory for n convex continuous optimization in the middle of 1990s Prof Douglas J White suggested that he explore an extension of his research results to integer pro gramming The two authors of the book started their collaborative work on integer programming and global optimization in 1997 The more they have investigated in nonlinear integer programming the more they need to further delve into the subject Both authors have been greatly enjoying working in this exciting and challenging field

Discrete Optimization I ,2000-04-01 Discrete Optimization I **Optimization in integers and related extremal problems** Thomas L. Saaty,2014-12-19 This text the first of its kind surveys the entire field of optimization in integers It is designed for students of mathematics engineering science social science and operations research It will stimulate and excite the reader s interest in the elementary methods and ideas of discrete optimization and related problems The text presents the current theories

and a wide variety of examples and applications of optimization in integers in both geometric and algebraic settings. Coverage is given to a wide class of problems and the ways in which they may be handled. The text includes numerous exercises and illustrations.

Optimization: Techniques And Applications (Icota '95) G Z Liu, 1995-09-01. With the advent of powerful computers and novel mathematical programming techniques the multidisciplinary field of optimization has advanced to the stage that quite complicated systems can be addressed. The conference was organized to provide a platform for the exchange of new ideas and information and for identifying needs for future research. The contributions covered both theoretical techniques and a rich variety of case studies to which optimization can be usefully applied.

Set Functions, Games and Capacities in Decision Making Michel Grabisch, 2016-06-15. The book provides a thorough treatment of set functions, games and capacities as well as integrals with respect to capacities and games in a mathematical rigorous presentation and in view of application to decision making. After a short chapter introducing some required basic knowledge (linear programming, polyhedra, ordered sets and notation) the first part of the book consists of three long chapters developing the mathematical aspects. This part is not related to a particular application field and by its neutral mathematical style is useful to the widest audience. It gathers many results and notions which are scattered in the literature of various domains: game theory, decision, combinatorial optimization and operations research. The second part consists of three chapters applying the previous notions in decision making and modelling decision under uncertainty, decision with multiple criteria, possibility theory and Dempster-Shafer theory.

Discrete Optimization E. Boros, P.L. Hammer, 2003-03-19. One of the most frequently occurring types of optimization problems involves decision variables which have to take integer values. From a practical point of view such problems occur in countless areas of management, engineering, administration, etc. and include such problems as location of plants or warehouses, scheduling of aircraft, cutting raw materials to prescribed dimensions, design of computer chips, increasing reliability or capacity of networks, etc. This is the class of problems known in the professional literature as discrete optimization problems. While these problems are of enormous applicability they present many challenges from a computational point of view. This volume is an update on the impressive progress achieved by mathematicians, operations researchers and computer scientists in solving discrete optimization problems of very large sizes. The surveys in this volume present a comprehensive overview of the state of the art in discrete optimization and are written by the most prominent researchers from all over the world. This volume describes the tremendous progress in discrete optimization achieved in the last 20 years since the publication of *Discrete Optimization* (77 Annals of Discrete Mathematics, volumes 4 and 5, 1979, Elsevier). It contains surveys of the state of the art written by the most prominent researchers in the field from all over the world and covers topics like neighborhood search techniques, lift and project for mixed 0-1 programming, pseudo-Boolean optimization, scheduling and assignment problems, production planning, location, bin packing, cutting planes, vehicle routing and applications to graph theory, mechanics, chip design, etc. Key features: state of the art
