Computational Methods For Optimizing Distributed Systems:

Computational Methods for Optimizing Distributed Systems Charles Teo,1984-08-21 Optimal control theory of distributed parameter systems has been a very active field in recent years however very few books have been devoted to the study of computational algorithms for solving optimal control problems For this reason the authors decided to write this book Because the area is so broad they confined themselves to optimal control problems involving first and second boundary value problems of a linear second order parabolic partial differential equation However the techniques used are by no means restricted to these problems They can be and in some cases already have been applied to problems involving other types of distributed parameter system The authors aim is to devise computational algorithms for solving optimal control problems with particular emphasis on the mathematical theory underlying the algorithms These algorithms are obtained by using a first order strong variational method or gradient type methods

Theory of Difference Equations Numerical Methods and Applications by V Lakshmikantham and D Trigiante Lakshmikantham,D. Trigiante,1988-05-01 In this book we study theoretical and practical aspects of computing methods for mathematical modelling of nonlinear systems A number of computing techniques are considered such as methods of operator approximation with any given accuracy operator interpolation techniques including a non Lagrange interpolation methods of system representation subject to constraints associated with concepts of causality memory and stationarity methods of system representation with an accuracy that is the best within a given class of models methods of covariance matrix estimation methods for low rank matrix approximations hybrid methods based on a combination of iterative procedures and best operator approximation and methods for information compression and filtering under condition that a filter model should satisfy restrictions associated with causality and different types of memory As a result the book represents a blend of new methods in general computational analysis and specific but also generic techniques for study of systems theory and its particular branches such as optimal filtering and information compression Best operator approximation Non Lagrange interpolation Generic Karhunen Loeve transform Generalised low rank matrix approximation Optimal data compression Optimal nonlinear filtering

Applied Optimal Control Theory of Distributed Systems K.A. Lurie,2013-11-21 This book represents an extended and substantially revised version of my earlier book Optimal Control in Problems of Mathematical Physics originally published in Russian in 1975 About 60% of the text has been completely revised and major additions have been included which have produced a practically new text My aim was to modernize the presentation but also to preserve the original results some of which are little known to a Western reader The idea of composites which is the core of the modern theory of optimization was initiated in the early seventies The reader will find here its implementation in the problem of optimal conductivity distribution in an MHD generator channel flow Since then it has emerged into an extensive theory which is undergoing a continuous development The book does not pretend to be a textbook neither does it offer a systematic presentation of the theory Rather it reflects a

concept which I consider as fundamental in the modern approach to optimization of distributed systems Bibliographical notes though extensive do not pretend to be exhaustive as well My thanks are due to Professor Jean Louis Armand and Professor Wolf Stadler whose friendly assistance in translating and polishing the text was so valuable I am indebted to Mrs Kathleen Durand and Mrs Colleen Lewis for the hard job of typing large portions of the manuscript

Control theory can be roughly classified as deterministic or stochastic Each of these can further be subdivided into game theory and optimal control theory The central problem of control theory is the so called constrained maximization which with slight modifications is equivalent to minimization One can then say heuristically that the major problem of control theory is to find the maximum of some performance criterion or criteria given a set of constraints The starting point is of course a mathematical representation of the performance criterion or criteria sometimes called the objective functional along with the constraints When the objective functional is single valued Le when there is only one objective to be maximized then one is dealing with optimal control theory When more than one objective is involved and the objectives are generally incompatible then one is dealing with game theory The first paper deals with stochastic optimal control using the dynamic programming approach The next two papers deal with deterministic optimal control and the final two deal with applications of game theory to ecological problems In his contribution Dr Marc Mangel applies the dynamic programming approach as modified by his recent work with Dr Colin Clark from the University of British Columbia Mangel and Clark 1987 to modelling the behavioral decisions of insects The objective functional is a measure of fitness Readers interested in detailed development of the subject matter may consult Mangel 1985 My contributions deal with two applications of optimal control theory *Computer Mathematics* ,1979 *Cornell University Courses of Study* Cornell University,2006 *Books in Print Supplement* ,1994 *Computers, Control & Information Theory* ,1982 *Australian Computer Journal* ,1983
