Cognitive Modeling Thad A. Polk, Colleen M. Seifert, 2002 A comprehensive introduction to the computational modeling of human cognition

Models and Cognition Jonathan A. Waskan, 2012-01-13 A groundbreaking argument challenging the traditional linguistic representational model of cognition proposes that representational states should be conceptualized as the cognitive equivalent of scale models In this groundbreaking book Jonathan Waskan challenges cognitive science's dominant model of mental representation and proposes a novel well devised alternative The traditional view in the cognitive sciences uses a linguistic propositional model of mental representation This logic based model of cognition informs and constrains both the classical tradition of artificial intelligence and modeling in the connectionist tradition It falls short however when confronted by the frame problem the lack of a principled way to determine which features of a representation must be updated when new information becomes available Proposed alternatives including the imagistic model have not so far resolved this problem Waskan proposes instead the Intrinsic Cognitive Models ICM hypothesis which argues that representational states can be conceptualized as the cognitive equivalent of scale models Waskan argues further that the proposal that humans harbor and manipulate these cognitive counterparts to scale models offers the only viable explanation for what most clearly differentiates humans from other creatures their capacity to engage in truth preserving manipulation of representations

Visual Cognition Steven Pinker, 1986-01-09 These essays tackle some of the central issues in visual cognition presenting experimental techniques from cognitive psychology new ways of modeling cognitive processes on computers from artificial intelligence and new ways of studying brain organization from neuropsychology to address such questions as How do we recognize objects in front of us How do we reason about objects when they are absent and only in memory How do we conceptualize the three dimensions of space Do different people do these things in different ways And where are these abilities located in the brain While this research which appeared as a special issue of the journal *Cognition* is at the cutting edge of cognitive science it does not assume a highly technical background on the part of readers The book begins with a tutorial introduction by the editor making it suitable for specialists and nonspecialists alike

Cognitive Models of Speech Processing Gerry T. M. Altmann, 1997 This collection of papers and abstracts stems from the third meeting in the series of Sperlonga workshops on Cognitive Models of Speech Processing It presents current research on the structure and organization of the mental lexicon and on the processes that access that lexicon The volume starts with discussion of issues in acquisition and consideration of questions such as What is the relationship between vocabulary growth and the acquisition of syntax and How does prosodic information concerning the melodies and rhythms of the language influence the processes of lexical and syntactic acquisition From acquisition the papers move on to consider the manner in which contemporary models of spoken word recognition and production can map onto neural models of the recognition and production processes The issue of exactly what is recognised and when is dealt with next the empirical findings suggest that

the function of something to which a word refers is accessed with a different time course to the form of that something This has considerable implications for the nature and content of lexical representations Equally important are the findings from the studies of disordered lexical processing and two papers in this volume address the implications of these disorders for models of lexical representation and process borrowing from both empirical data and computational modelling The final paper explores whether neural networks can successfully model certain lexical phenomena that have elsewhere been assumed to require rule based processes

Cognitive Models Of Speech Processing Gerry Altmann, Richard Shillcock, 2013-05-24 A comprehensive review for those interested in the range of theoretical concerns in speech and language processing

Computational and Cognitive Models of Creative Design VI John S. Gero, Mary Lou Maher, 2005

Connectionism and the Philosophy of Mind J. Tienson, 1991-10-31 This series will include monographs and collections of studies devoted to the investigation and exploration of knowledge information and data processing systems of all kinds no matter whether human other animal or machine Its scope is intended to span the full range of interests from classical problems in the philosophy of mind and philosophical psychology through issues in cognitive psychology and sociobiology concerning the mental capabilities of other species to ideas related to artificial intelligence and to computer science While primary emphasis will be placed upon theoretical conceptual and epistemological aspects of these problems and domains empirical experimental and methodological studies will also appear from time to time One of the most if not the most exciting developments within cognitive science has been the emergence of connectionism as an alternative to the computational conception of the mind that tends to dominate the discipline In this volume John Tienson and Terence Horgan have brought together a fine collection of stimulating studies on connectionism and its significance As the Introduction explains the most pressing questions concern whether or not connectionism can provide a new conception of the nature of mentality By focusing on the similarities and differences between connectionism and other approaches to cognitive science the chapters of this book supply valuable resources that advance our understanding of these difficult issues

J H F *The Future of the Cognitive Revolution* David Johnson, Christina Erneling, 1997-04-24 The basic idea of the particular way of understanding mental phenomena that has inspired the cognitive revolution is that as a result of certain relatively recent intellectual and technological innovations informed theorists now possess a more powerfully insightful comparison or model for mind than was available to any thinkers in the past The model in question is that of software or the list of rules for input output and internal transformations by which we determine and control the workings of a computing machine s hardware Although this comparison and its many implications have dominated work in the philosophy psychology and neurobiology of mind since the end of the Second World War it now shows increasing signs of losing its once virtually unquestioned preeminence Thus we now face the question of whether it is possible to repair and save this model by means of relatively inessential tinkering or whether we must reconceive it fundamentally and replace it with something different In this book twenty eight leading

scholars from diverse fields of cognitive science linguistics psychology neurophysiology and philosophy present their latest carefully considered judgements about what they think will be the future course of this intellectual movement that in many respects has been a watershed in our contemporary struggles to comprehend that which is crucially significant about human beings Jerome Bruner Noam Chomsky Margaret Boden Ulric Neisser Rom Harre Merlin Donald among others have all written chapters in a non technical style that can be enjoyed and understood by an inter disciplinary audience of psychologists philosophers anthropologists linguists and cognitive scientists alike

The Cognitive Brain Arnold Trehub, 1991 The Cognitive Brain provides an original account of many aspects of cognition It explains in terms of specified neuronal mechanisms and systems how the human brain does its cognitive work

Encyclopedia of Cognitive Science: Mental models Lynn Nadel, 2003 At the core of this encyclopedia are approximately 700 original signed articles written and peer reviewed by the world s leading experts in their various specialized areas of the cognitive sciences

Neural Computation, 2001 The American Psychologist, 2001 Includes proceedings of the 54th 55th annual meetings of the association 1946 47 and proceedings of meetings of various regional psychological associations

Conceptual Spaces Peter Gardenfors, 2004-01-30 Within cognitive science two approaches currently dominate the problem of modeling representations The symbolic approach views cognition as computation involving symbolic manipulation Connectionism a special case of associationism models associations using artificial neuron networks Peter G rdenfors offers his theory of conceptual

representations as a bridge between the symbolic and connectionist approaches Symbolic representation is particularly weak at modeling concept learning which is paramount for understanding many cognitive phenomena Concept learning is closely tied to the notion of similarity which is also poorly served by the symbolic approach Gerd Gärdenfors's theory of conceptual spaces presents a framework for representing information on the conceptual level A conceptual space is built up from geometrical structures based on a number of quality dimensions The main applications of the theory are on the constructive side of cognitive science as a constructive model the theory can be applied to the development of artificial systems capable of solving cognitive tasks Gärdenfors also shows how conceptual spaces can serve as an explanatory framework for a number of empirical theories in particular those concerning concept formation induction and semantics His aim is to present a coherent research program that can be used as a basis for more detailed investigations Computational Linguistics, 1992

Cognitive and Ecological Approaches to Perception William W. Gaver, University of California, San Diego. Institute for Cognitive Science, 1988 High-level Connectionist Models John A. Barnden, Jordan B. Pollack, 1991 Presenting research on the computational abilities of connectionist neural and neurally inspired systems this series emphasizes the question of how connectionist or neural network models can be made to perform rapid short term types of computation useful in higher cognitive processes The most recent volumes are directed mainly at researchers in connectionism analogy metaphor and case based reasoning but are also suitable for graduate courses in those areas **Journal of Cognitive Neuroscience**, 1992 **UM99 User Modeling** Judy Kay, 1999-07-05 User modeling researchers look for ways of enabling interactive software systems to adapt to their users by constructing maintaining and exploiting user models which are representations of properties of individual users User modeling has been found to enhance the effectiveness and or usability of software systems in a wide variety of situations Techniques for user modeling have been developed and evaluated by researchers in a number of fields including artificial intelligence education psychology linguistics human computer interaction and information science The biennial series of International Conferences on User Modeling provides a forum in which academic and industrial researchers from all of these fields can exchange their complementary insights on user modeling issues The published proceedings of these conferences represent a major source of information about developments in this area
