

HOW A COLD CHAIN WORKS

Ensuring your temperature-sensitive payload remains at the required temperature throughout the cold chain is paramount to ensuring its efficacy when it arrives at its destination. We've used a pharmaceutical cold chain to illustrate how each stage of a cold chain logistics network works.

For overseas travel, drugs and vaccines will travel via cargo planes. Ensuring the packaging is robust, and qualified to keep the payload at the right temperature on potentially long journeys is essential.

Up until now, the temperature-sensitive payload has travelled in mass shipments with global logistics firms, however this step requires local smaller scale 'last mile' cold chain logistics, that must not break the cold chain that has been maintained up until this point.

STEP 1 RESEARCH AND DEVELOPMENT

Once a drug or vaccine has passed medical trials, it will need to be shipped to manufacturers where it'll be produced at volume to meet consumer demand.

STEP 2 DRUG MANUFACTURERS

Depending on the chemical makeup of the drug or vaccine being manufactured, it'll need to be stored at the correct temperature, and then shipped within this temperature range for the remainder of its journey.

STEP 3 DISTRIBUTION HUBS

Once drugs and vaccines arrive in country, their temperature-controlled journey will continue via national and regional distribution hubs, on their way to end-user locations.

STEP 4 HEALTHCARE FACILITY

Having arrived safely at pharmacies and healthcare facilities, the drug or vaccine will need to be stored at the correct temperature until it's administered to an end user patient.
