**The Coevolution of Climate and Life** Stephen Henry Schneider, Randi Londer, 1984 *Climate Change and Life*  
Gabriel M. Filippelli, 2022-11-16 Approx 276 pages Examines the link between climate change and extinctions in the geosphere atmosphere and biosphere Explores the concept of ecological resilience the principal reason why the Earth has remained continuously inhabited by organisms for almost four billion years Discusses how the ongoing influences of climate change will continue to shape a planet that will head toward extremes Encyclopedia of Ecology Brian D. Fath, 2014-11-03  
The groundbreaking Encyclopedia of Ecology provides an authoritative and comprehensive coverage of the complete field of ecology from general to applied It includes over 500 detailed entries structured to provide the user with complete coverage of the core knowledge accessed as intuitively as possible and heavily cross referenced Written by an international team of leading experts this revolutionary encyclopedia will serve as a one stop shop to concise stand alone articles to be used as a point of entry for undergraduate students or as a tool for active researchers looking for the latest information in the field Entries cover a range of topics including Behavioral Ecology Ecological Processes Ecological Modeling Ecological Engineering Ecological Indicators Ecological Informatics Ecosystems Ecotoxicology Evolutionary Ecology General Ecology Global Ecology Human Ecology System Ecology The first reference work to cover all aspects of ecology from basic to applied Over 500 concise stand alone articles are written by prominent leaders in the field Article text is supported by full color photos drawings tables and other visual material Fully indexed and cross referenced with detailed references for further study Writing level is suited to both the expert and non expert Available electronically on ScienceDirect shortly upon publication **Ecological Climatology** Gordon Bonan, 2016 The thoroughly updated new edition of Gordon Bonan's comprehensive textbook on terrestrial ecosystems and climate change for advanced students and researchers Laboratory Earth Steven H Schneider, 2014-11-25 Laboratory Earth taps the relevant knowledge from physical biological and social sciences needed to study the planet holistically This so called Earth Systems Science fosters a new way to understand the Earth and our roles as inhabitants with the purpose of building solutions to the bewildering global environment and overdevelopment Educational business health and governmental organizations often dissect the world into narrow but highly specialized disciplines economics ecology cardiology meteorology glaciology or political science to name a few But real world problems like urban sprawl public health poverty toxic waste economic development the ozone hole or global warming do not fit neatly into disciplinary boxes However author Stephen Schneider asserts that these contemporary issues must be viewed as systems of interconnected subelements This is especially true for global environmental problems since they arise from increasing numbers of people demanding higher standards of living and willing to use the cheapest available technologies to pursue these growth oriented goals even if the unintended byproducts include land degradation toxic pollutants species extinctions or global climate change To first understand and then solve such problems we must learn to view the Earth and

our socioeconomic engine as one integrated system Schneider who in the 1970s predicted global warming would become demonstrable by the turn of the century chooses that debate to illustrate how this twenty first century Earth Systems Science approach works introducing us to the sharp controversies and highly visible debates among climatologists ecologists economists industrialists and political interests over the seriousness and solutions to the climate change crisis He begins with a fascinating journey to the beginning of geologic time on Earth and traces from there the coevolution of climate and life over the next four billion years Along the way we learn about the Gaia Hypothesis the demise of the dinosaurs and the likelihood of an impending ice age Schneider traces our climatic history not only from the beginning and up to the twentieth century but deep into the twenty first as well He depicts the next one hundred years as a potentially perilous period for climate and life unless we citizens of Earth recognize and then work to control the unintended global scale experiment we are foisting on ourselves and all other life on Laboratory Earth This lab is not built of glass wires and tubes but of insects soils air oceans birds trees and people While no honest scientist can claim to have clairvoyant vision into the twenty first century Schneider optimistically demonstrates that enough is already known to command our attention and to insure that the juggernaut of human impacts on Earth doesn't turn into a gamble we can't afford to lose
