communication and computing applications In recent years the multimedia techno **The Regularized Fast Hartley Transform** Keith John Jones, 2021-09-03 This book describes how a key signal image processing algorithm that of the fast Hartley transform FHT or via a simple conversion routine between their outputs of the real data version of the ubiquitous fast Fourier transform FFT might best be formulated to facilitate computationally efficient solutions The author discusses this for both 1 D such as required for example for the spectrum analysis of audio signals and m D such as required for example for the compression of noisy 2 D images or the watermarking of 3 D video signals cases but requiring few computing resources i e low arithmetic memory power requirements etc This is particularly relevant for those application areas such as mobile communications where the available silicon resources as well as the battery life are expected to be limited The aim of this monograph where silicon based computing technology and a resource constrained environment is assumed and the data is real valued in nature has thus been to seek solutions that best match the actual problem needing to be solved **The**

Regularized Fast Hartley Transform Keith Jones, 2010-03-10 Most real world spectrum analysis problems involve the computation of the real data discrete Fourier transform DFT a unitary transform that maps elements N of the linear space of real valued N tuples R to elements of its complex valued N counterpart C and when carried out in hardware it is conventionally achieved via a real from complex strategy using a complex data version of the fast Fourier transform FFT the generic name given to the class of fast algorithms used for the efficient computation of the DFT Such algorithms are typically derived by exploiting the property of symmetry whether it exists just in the transform kernel or in certain circumstances in the input data and or output data as well In order to make effective use of a complex data FFT however via the chosen real from complex N strategy the input data to the DFT must first be converted from elements of R to N elements of C The reason for choosing the computational domain of real data problems such $N \times N$ as this to be C rather than R is due in part to the fact that computing equipment manufacturers have invested so heavily in producing digital signal processing DSP devices built around the design of the complex data fast multiplier and accumulator MAC an arithmetic unit ideally suited to the implementation of the complex data radix 2 butterfly the computational unit used by the familiar class of recursive radix 2 FFT algorithms **Official Gazette of the United States Patent and Trademark Office**, 1995 **Fast Fourier**
