When multiple forces act on an object, they combine to determine the net force, which determines whether the object speeds up, slows down, or changes direction. Understanding how forces act together is essential to explaining various observations from a physics world, such as a ball's trajectory or a car's acceleration.</p> <p>Newton's second law of motion states that the acceleration of an object is directly proportional to the net force acting on it and inversely proportional to its mass. This means that if the net force increases, the acceleration increases proportionally, but if the mass increases, the acceleration decreases proportionally for a given force.</p> <p>Newton's third law of motion states that for every action, there is an equal and opposite reaction. This means that if one object exerts a force on another, the second object exerts an equal and opposite force back on the first. This principle is essential for understanding the stability of structures, the propulsion of rockets, and the interaction between objects in contact.</p> </div> <p>Read the passage carefully before answering the questions that follow.</p> <ol style="list-style-type: none"> Which of the following is not a type of contact force? <ol style="list-style-type: none"> Friction of forces.
