

Chapter 5 – Elasticity and Its Applications

Do they depend upon the answers to these questions?

- What is elasticity? What kinds of factors can increase, decrease, or stabilize it?
- What is the price elasticity of demand? How is it related to the demand curve? How is it related to demand's steepness?
- What is the price elasticity of supply? How is it related to the supply curve?
- What are the income and cross-price elasticities of demand?

It follows:

Two things influence the level of demand:

the change in price of a good, and changes in its buyers' real income.

How does the price change affect the opportunity cost of your money, and your willingness to spend your money on it?

How does a change in your real income affect your willingness to buy that good? How does that affect demand? How does it affect your demand for all other goods?

Finally:

- Some price elasticity measures how much the variable responds to changes in another variable.
 - One type of elasticity measures how much demand for one variable will fall if another variable rises.
- Another elasticity is a formal measure of the responsiveness of Q^D to P or Q^S to one of its determinants.

Price Elasticity of Demand

- Price elasticity of demand measures how much Q^D responds to a change in P .
- It measures the price sensitivity of buyers' demand.

$$\text{Price elasticity of demand} = \frac{\text{Percentage change in } Q^D}{\text{Percentage change in } P}$$

Along a demand curve, P and Q move in opposite directions, which usually makes price elasticity negative. We will drop the minus sign and report absolute values of price elasticity.

Example:

The price elasticity of demand for apples is 0.50. If the price of apples falls 10 percent, the quantity demanded will rise by 5 percent.

Calculating Percentage Changes

Price falls from 100 to 90, a change of 10 percent.

Quantity falls

from 100 to 95, a change of 5 percent.
