Superconducting Materials for High Energy Colliders Luisa Cifarelli, 2001 The ELOISATRON ELN Project aims at a future proton supercollider with 100 500 TeV energy per beam and 1034 1036 cm 2s 1 luminosity While the Large Hadron Collider LHC is being implemented at CERN it is very timely to study the feasibility of the next generation of hadron colliders at the extreme limits of energy and luminosity In this respect the achievement of extremely high magnetic fields and the production of accelerating rf cavities with very low losses are a crucial point in the actual construction design of such a collider The search for superconducting materials with suitable properties to be used in this field has gained a new impulse after the discovery of the so called high temperature superconducting compounds HTSCs with superconducting critical temperatures higher than 100 K Besides the critical temperatures the transport performances of this class of compounds are still very far from allowing applications in extremely high energy colliders On the other hand in the last few years the technological and scientific improvements obtained for both the HTSCs and the conventional superconducting materials are very promising This book reviews the recent status of R D on the rising generation of superconducting materials for accelerator magnets and cavities and discusses novel aspects and
