Abstract

Based on Riemann theta function and bilinear Bäcklund transformation, quasi-periodic wave solutions are constructed for an extended $(2 + 1)$ -dimensional shallow water wave equation. A detail asymptotic analysis procedure to the one- and two-periodic wave solutions are presented, and the asymptotic properties of this type of solutions are proved. It is shown that the quasi-periodic wave solutions converge to the soliton solutions under small amplitude limits.

1 Introduction

Nonlinear evolution equations (NLEEs) have attracted much interest in the past few decades since they appear in many areas of scientific fields such as fluid mechanics, plasma physics, solid-state physics, and mathematical biology [1–4]. The investigation of solutions for NLEEs plays an important role in the study of nonlinear physical phenomena, and many effective methods have been discovered. Successful numerical methods include the decomposition method [5] and the spectral method [6–11] developed in recent years. Various analytic methods such as inverse scattering method, Darboux transformation, Bäcklund transformation, Hirota method, and algebro-geometrical approach [12–16] have been presented for NLEEs. Among the mentioned methods, the algebro-geometrical approach presents quasi-periodic or algebro-geometric solutions to many NLEEs. However, the approach needs Lax pair representations and involves complicated calculus on Riemann surfaces. Based on bilinear forms, Nakamura proposed a straightforward way to construct a kind of quasi-periodic solutions of nonlinear equations [17, 18], where the quasi-periodic wave solutions of the Korteweg-de Vries equation (KdV equation) and the Boussinesq equation were obtained by using the Riemann theta function. Recently, Hon and Fan have developed this method to investigate $(2 + 1)$ -dimensional Bogoyavlenskii's breaking soliton equation [19], the discrete Toda lattice [20], and the asymmetrical Nizhnik-Novikov-Veselov equation [21]. Ma [22] constructed one-periodic and two-
