When multiple forces act on an object, they combine to produce a net force, which determines whether the object speeds up, slows down, or changes direction. Understanding how forces act together is essential to explaining various phenomena, from a ball being kicked to a rocket launching into space.</p> <p>Newton's second law of motion states that the acceleration of an object is directly proportional to the net force acting on it and inversely proportional to its mass. This means that if the net force increases, the acceleration increases proportionally, but if the mass also increases, the acceleration will decrease. For example, pushing a heavy box with a small force will result in a small acceleration, while pushing a lighter box with the same force will result in a larger acceleration.</p> <p>Friction is a contact force that opposes the direction of motion. It acts between two surfaces in contact, whether they are solid, liquid, or gas. Friction is caused by the roughness of the surfaces and the molecular forces between them. It is essential for many everyday activities, such as walking, driving, and holding objects. Without friction, objects would slide across surfaces without any resistance, making it impossible to perform most tasks.</p> </div> <p>Answer the questions that follow.</p> <ol style="list-style-type: none"> Which of the following is not a type of contact force? <ol style="list-style-type: none"> Force of friction.
