

A user-led survey of people with a personality disorder diagnosis finds a group more sinned against than sinning

# A dangerous diagnosis

**T**he modern concept of personality disorder is represented by two connected notions: either that the personality abnormality causes problems to self and/or others or that the behaviour is so anti-social as to be dangerous to society. The American and European psychiatric diagnostic manuals refer to personality disorders as 'enduring patterns of behaviour that deviate markedly from the expectations of the individual's culture', and 'pervasive, inflexible deficits that are stable over time'. This gives the service user little cause for any hope at all. It is a category that does not have much scientific credibility and it is a diagnosis that is often hidden from patients, and one where untreatability is still a widely held belief.

This article tells the story of a study carried out for and by service users with a personality disorder diagnosis. The idea for the research came through a group of local service users with the diagnosis, who contacted the advocacy service run by Mind at the acute mental health unit at Colchester general hospital. I had advocated for most of them for some years and we had established an association and trust. The spark was the publication by the Home Office and the Department of Health in July 1999 of proposals for managing so-called dangerous people with severe personality disorder, which would consign them to special units as a preventive measure even if there were no deterioration in their clinical state.<sup>1</sup> We began to hear from anxious service users who had at some time received the personality disorder diagnosis or had at one time assaulted another person, however minor the incident. Their fears were not calmed by the government's assurance that indefinite detention would apply only to a tiny number of people.

We decided to seek an account, from their own experiences, of the inner world of people who have been given a diagnosis of personality disorder.

Our group of 18 met monthly throughout 1999. Five expressed a wish to train as research interviewers to conduct the fieldwork and embarked on a training programme devised with the assistance of Anglia Polytechnic University for this purpose. We obtained a research grant from the university so we could pay the researchers £30 for each interview and participants £10 for their time.

It is important to understand that the researchers were not 'survivors' engaged in a retrospective study but rather 'sufferers' struggling for emotional equilibrium while engaged in a research endeavour. Ever-present was the question of who might relapse next and ethical dilemmas about the stressful nature of the work and how that might be affecting the researchers. Our five researchers reduced to four almost as soon as the training programme began, and two of these were admitted to hospital in the course of the study. The other members of the group continued their support, joining us to meet each month, some from hospital wards, some even when under section.

Our research approach was emancipatory, described by Freire<sup>2</sup> as an approach that challenges the validity of the privileged analysing the underprivileged. With the help of two skilled supervisors from Anglia Polytechnic University we created an interview questionnaire that used a blend of qualitative and quantitative methods, starting with a semi-structured interview to give primacy to the voice of the service user. We asked them what the term 'personality disorder' meant to them; how they found out about their diagnosis; what they would say were their problems; the implications of the diagnosis; their experiences of mental health and other services and what, in an ideal world, they wanted from the services with which they were in contact. We also asked them what they saw as their strengths; it was, we felt, important to counteract the uniformly negative attributions of the diagnosis. The quantitative component comprised a →

Throughout the world schizophrenia is a diagnosis now in decline representing a radical shift in our historical and medical understanding of madness and mental distress But what does this medical term first coined by a Swiss psychiatrist in 1908 mean And why is it increasingly unpopular among patients and the medical establishment Historian and clinician Orna Ophir unearths the stories of patients and doctors as they struggle to make sense of this debilitating condition At different times patients have been depicted as possessed by demons or simply inspired as hearing voices suffering from a split mind or merely having difficulty in integrating experiences Now a century after its birth schizophrenia is increasingly viewed not as a radical abnormal disease defined by an ever changing cluster of symptoms but the extreme end of a spectrum on which we are all located The story Ophir tells is a hopeful one As patients and doctors sought to overcome stigma and improve therapeutic outcomes they have shown ever greater sensitivity to diversity and difference Schizophrenia An Unfinished History gestures toward a future in which clinicians and patients will collaborate in the search for better
