Biochemistry is the branch of science that studies the chemical reactions and compounds found in living things. Molecular biology is the study of the molecular processes underlying biological activities; it aspires to shed light on the cellular or molecular complexity of life. Structure and function in biomolecules including proteins, carbohydrates, lipids, and nucleic acids are among the many subjects covered by this branch of biology. Its primary objective is to understand the complex molecular mechanisms that are the foundation of the basic processes that are fundamental to life. This book serves as a complete reference to the fundamentals and complexities of basic biochemistry. It provides an expedition into the molecular world where cellular architecture and metabolic pathways are responsible for conducting the symphony of life. Exploring the intricacies of biomolecules such as proteins, nucleic acids, lipids, and carbohydrates, this book delves into the roles these molecules play in regulating biological processes, cell functioning, and signal transmission. By blending contemporary research with traditional concepts, the book offers a dynamic perspective that highlights the ever-changing nature of biological events. Using clear explanations and graphics that illustrate concepts and examples, the purpose of this book is to inspire the interest of the next generation of scientists, encourage them to make discoveries, and equip them with the tools necessary to traverse the fascinating landscape of general biochemistry.
