

Femoral Neck Fractures

Basic facts

The top of proximal part of the femur bone consists of the femoral head, femoral neck, greater trochanter, lesser trochanter and metaphysis. The femoral head articulates with the acetabulum or the cup of the hip joint.

A fracture is synonymous with a broken bone. When a fracture occurs through the neck of the femur, the hip joint is no longer function. The most common cause of a femoral neck fracture is trauma such as being struck by a motorized vehicle or taking a fall.

Cause of fracture

Femoral neck fractures typically are from trauma. This may include being hit by a motor vehicle or from an object or person falling on the pet.

Diagnosis

Radiographs (x-rays) are needed to diagnose the condition of a femoral neck fracture. Other testing that may be recommended includes blood work such as a complete blood count and chemistry profile. CT scan of the body may be recommended if the pet has been hit by a car.

Surgery

Femoral neck fractures require surgery for a successful outcome. For a simple neck fracture, two screws or a screw and a pin are usually adequately strong to allow for uncomplicated healing. If the fracture is more extensive and includes a femoral neck fracture and a greater trochanter fracture or metaphyseal fracture, a bone plate and multiple screws are used to secure the bones in place. If a femoral neck fracture cannot be repaired, total hip replacement may be an option.

Basic Facts Of Fractures
