Crystal Structures M Ladd, 1999-06-01 This survey of the important types of inorganic and organic crystal structures treats its subject thoroughly and in sufficient depth for undergraduate modules in chemistry courses Features of this book are the instructions for 3D stereoviewing which is central to a full appreciation of the presentation Clear directions for making your own stereo have been provided in the book which enables readers to examine the plentiful stereo of lattices and crystal structures which are illustrated The introductory chapter explains point group and space group symmetry insofar as required to understand lattices and crystal structures Crystal structures are sub divided according to the atomic force mainly responsible for cohesion in the solid state The descriptions of the structures are given in crystallographic terms including data on the space group molecular symmetry and molecular geometry Discussions of bonding theory for each sub division of the structures enhance and strengthen the author's presentation The book stems from the author's successful lecture courses tested and refined in class teaching It draws as necessary on equilibrium thermodynamics and other chemical topics with avoidance of advanced mathematics A level being the prerequisite Examines the important types of inorganic and organic crystal structures Includes instructions for making simple stereoviewers and computer programs Draws as necessary on equilibrium thermodynamics and other chemical topics with avoidance of advanced mathematics Crystal Structure Analysis Jenny Pickworth Glusker, Kenneth N. Trueblood, 2010-05-27 This book aims to explain how and why the detailed three dimensional architecture of molecules can be determined by an analysis of the diffraction patterns obtained when X rays or neutrons are scattered by the atoms in single crystals Part 1 deals with the nature of the crystalline state diffraction generally and diffraction by crystals in particular and briefly the experimental procedures that are used Part II examines the problem of converting the experimentally obtained data into a model of the atomic arrangement that scattered these beams Part III is concerned with the techniques for refining the approximate structure to the degree warranted by the experimental data It also describes the many types of information that can be learned by modern crystal structure analysis There is a glossary of terms used and several appendixes to which most of the mathematical details have been relegated Science of Crystal Structures Istvan Hargittai, Balazs Hargittai, 2015-09-09 A volume which includes entries on quasicrystals icosahedral packing other packing considerations extended structures data treatment and data mining is presented by luminaries from the crystallography community Several of the contributions are from the schools of such trend setting crystallographers as J Desmond Bernal and Aleksandr I Kitaigorodskii Internationally renowned scientists contributed such as Tom L Blundell Johann Jacob Burckhardt John L Finney Jenny P Glusker Nobel laureate Herbert A Hauptman the 2014 Ewald Prize winner A Janner Aminoff Prize winner Isabella Karle Nobel laureate Jerome Karle Buckley Prize winner Alan L Mackay Ewald Prize winner David Sayre Vladimir Shevchenko and J Fraser Stoddart A few frontier topics dominate the selected material Pioneers of the direct methods describe the phase problem and how it was solved including the mathematical approach and the

utilization of experience with gas phase electron diffraction The reviews by Herbert Hauptman Jerome and Isabella Karle and David Sayre reach to the present day in assessing the possibilities of X ray crystallography Another focus topic is the investigation of systems that are outside the so called classical system of crystals They include quasicrystals imperfect and very small crystals supramolecular species crystal structures without lattice clusters nanomaterials among others Application of synchrotron and cryoprotection techniques the free electron laser flash technique and others are mentioned in addition to X ray crystallography The relationship between structural and materials properties are examined and uncovered The broader topics of the so called generalized crystallography include polymers clusters polydisperse chain assemblies and giant icosahedral fullerenes There are some key contributions related to the structural investigation of biological macromolecules
