McFadden, 2011-06-01 Never in human history have there been so many people entering old age roughly one third of whom will experience some form of neurodegeneration as they age This seismic demographic shift will force us all to rethink how we live and deal with our aging population Susan H McFadden and John T McFadden propose a radical reconstruction of our societal understanding of old age Rather than categorizing elders based on their cognitive consciousness the McFaddens contend that the only humanistic supportive and realistic approach is to find new ways to honor and recognize the dignity worth and personhood of those journeying into dementia Doing so they argue counters the common view of dementia as a personal tragedy shared only by close family members and replaces it with the understanding that we are all living with dementia as the baby boomers age particularly as early screening becomes more common and as a cure remains elusive The McFaddens inclusive vision calls for social institutions especially faith communities to build supportive ongoing friendships that offer hospitality to all persons regardless of cognitive status Drawing on medicine social science philosophy and religion to provide a broad perspective on aging Aging Together offers a vision of relationships filled with love joy and hope in the face of a condition that all too often elicits anxiety hopelessness and despair **Communication and Cognition in Normal Aging and Dementia** Kathryn A. Tomoeda, 1987 **Dementia, Frailty and Aging** Marco Canevelli, Matteo Cesari, Wee Shiong Lim, 2018-07-03 The number of older subjects is rapidly increasing worldwide As a consequence the nature of clinical conditions is also changing Traditional medicine and models of care have been based on the evaluation and treatment of single and usually acute conditions occurring in relatively young individuals Today the usual clinical manifestation of diseases is characterized by multiple and often chronic conditions affecting older people In this scenario frailty and dementia have been triggering special interest both in research and clinical settings due to their high prevalence impact on the individual s quality of life and consequences for public health worldwide These conditions aptly reflect the complexity of age related pathological conditions finding as causal factor a myriad of heterogeneous interacting and often still unclear pathophysiological processes Indeed their study is strongly affected by the difficulty to differentiate the effects of a normal aging process from eventual pathological deviations of the underlying systems Their occurrence and trajectories over time are strongly affected by a wide array of factors and determinants that can be hardly attributed to the deficit involvement of single biological systems and or health domains Moreover environment

and social factors also play a key role in the determination of phenotypes The present Research Topic is aimed at widening our understanding of the frailty and dementia phenomena occurring with aging in order to improve the clinical and public health approaches to these burdening conditions
