Hadziselimovic, 2012-12-06 Cytological techniques have greatly improved in the last twenty years largely as a result of further development of the microscope Electron microscopy in particular has opened up great prospects for the study of cell morphology while the develop ment of radio immuno assay has brought great progress in endocrinology The applica tion of these two techniques which are complementary to each other and provide mutually supporting evidence is the subject of this monograph The work is divided into two parts The first deals with the ultrastructure of normal testicular development describing four main elements of the testicle the germ cells the Sertoli cells the peri tubular connective tissue and the Leydig cell with details of their individual development To make the electron micrographs more easily understandable diagrams have been used to explain the most important points The second part deals with cryptorchid testicles including the primary and sec ondary changes involved and morphometric studies of the secondary changes The significance of these ultrastructural observations for the treatment of cryptorchidism is emphasized With the aid of radio immuno assay the level

of testosterone in cryptorchid mice was determined and comparisons drawn between the ultrastructural changes in cryptorchidism in mouse and man. The experimental studies served as a basis for the hypothesis that in all probability a congenital disturbance of the hypothalamo-hypophyseal-gonadal axis is responsible for cryptorchidism. I hope that this monograph will contribute towards a better understanding of normal and cryptorchid testicular development and of the etiology of cryptorchidism.

In the past half century great progress has been made in the reproductive management of farm animals both mammals and birds. This book aims to review developments and indicate which reproductive technologies can be used commercially or in research. It begins by discussing artificial insemination and how this has recently been refined in semen sexing technology. Embryo transfer, in vitro embryo production technology and the control of oestrus and ovulation are then reviewed. Subsequent chapters consider the control of postpartum ovarian activity, seasonal breeding, multiple births and litter size, pregnancy testing, parturition and the onset of puberty. The author then describes more recent developments in cloning and the production of transgenic animals before a final chapter on suppressing reproductive activity.
