

Chapter 5 – Elasticity and Its Applications

Do they depend both on the numbers of firms and on the price?

- What is elasticity? What kinds of factors can increase, decrease, or stabilize it?
- What is the price elasticity of demand? How is it related to the demand curve? How is it related to demand's steepness?
- What is the price elasticity of supply? How is it related to the supply curve?
- What are the income and cross-price elasticities of demand?

Key Issues:

How do we measure the price elasticity?

How do we measure income and cross-price elasticities and the elasticity of supply?

How do we use price elasticity in understanding the opportunity cost of your time, the value of knowing the going rate for a job?

How do we measure the deadweight loss of a tax? How do we measure the deadweight loss of a price ceiling? How do we measure the deadweight loss of a price floor?

Key Points:

- Elasticity measures how much one variable changes in response to a change in another variable.
 - One type of elasticity measures the change in demand for one variable with respect to another variable.
- Elasticity:
 - Measuring it is somewhat measure of the responsiveness of Q^D to a change in P .

Price Elasticity of Demand

- Price elasticity of demand measures how much Q^D responds to a change in P .
- It measures the price sensitivity of demand.

$$\text{Price elasticity of demand} = \frac{\text{Percentage change in } Q^D}{\text{Percentage change in } P}$$

Along a straight line, P and Q move in opposite directions, which would make price elasticity negative. But we take the absolute value and report relative changes as positive numbers.

Example:

The price elasticity of demand is 0.5. If the price of a good falls by 10%, the quantity demanded will increase by 5%.

Calculating Percentage Changes

Price falls from 100 to 90, a change of 10 percent.

Quantity falls.

Quantity falls by 5 percent, a change of 5 percent.
