**Embodied and grounded cognition** Anna Borghi,Diane Pecher,2012-01-01 In the last 10 15 years the embodied and grounded cognition approach has become widespread in all fields related to cognitive science such as cognitive and social psychology neuroscience philosophy anthropology computational modelling and robotics According to this approach our cognitive activity is grounded in sensory motor processes and situated in specific contexts and situations Therefore in this view concepts consist of the reactivation of the same neural pattern that is present when we

perceive and or interact with the objects they refer to In the same way understanding language would imply forming a mental simulation of what is linguistically described This simulation would entail the recruitment of the same neurons that are activated when actually acting or perceiving the situation action emotion object or entity described by language In the last years a lot of evidence has been collected in favour of EC and GC view The aim of this Research Topic is twofold First it intends to give an idea of the field of embodied and grounded cognition in its broadness We therefore intend to invite scientists of different disciplines anthropology philosophy linguistics cognitive and social psychology neuroscience computer science to submit their proposals The second aim of this Research Topic is to focus on some challenges that in our opinion embodied and grounded theories of cognition need to face First we believe that one important challenge for EC and GC views is to account for the way the so called abstract concepts and abstract words are represented Evidence on the representation of concrete concepts and words is compelling whereas evidence on abstract concepts representation is still too scarce and limited to restricted domains We therefore welcome proposals dealing with this complex issue Second we think that embodied and grounded theories of cognition would need to formulate more precise hypotheses and that in general within the field a larger theoretical effort should be made It is striking that even if a lot of work in the field of computational modelling and robotics starts from an embodied approach experimental and modelling work on embodied cognition remain somehow separate We therefore invite researchers to submit papers proposing models which might help to explain phenomena as well as to constrain and specify in more detail the predictions and the claims advanced within the framework of EC and GC theories

*Motion Correction in MR* Andre van der Kouwe, Jalal B. Andre, 2022-10-28

Motion Correction in MR Correction of Position Motion and Dynamic Changes Volume Eight provides a comprehensive survey of the state of the art in motion detection and correction in magnetic resonance imaging and magnetic resonance spectroscopy The book describes the problem of correctly and consistently identifying and positioning the organ of interest and tracking it throughout the scan The basic principles of how image artefacts arise because of position changes during scanning are described along with retrospective and prospective techniques for eliminating these artefacts including classical approaches and methods using machine learning Internal navigator based approaches as well as external systems for estimating motion are also presented along with practical applications in each organ system and each MR modality covered This book provides a technical basis for physicists and engineers to develop motion correction methods giving guidance to technologists and radiologists for incorporating these methods in patient examinations Provides approaches for correcting scans prospectively and retrospectively Shows how motion and secondary effects such as field changes manifest in MR scans as artifacts and subtle biases in quantitative research Gives methods for measuring motion and associated field changes quantifying motion and judging the accuracy of the motion and field estimates
