## **Aggregation In Largescale Optimization:**

*Aggregation in Large-Scale Optimization* I. Litvinchev, Vladimir Tsurkov, 2013-12-01 When analyzing systems with a large number of parameters the dimension of the original system may present insurmountable difficulties for the analysis It may then be convenient to reformulate the original system in terms of substantially fewer aggregated variables or macrovariables In other words an original system with an  $n$  dimensional vector of states is reformulated as a system with a vector of dimension much less than  $n$  The aggregated variables are either readily defined and processed or the aggregated system may be considered as an approximate model for the original system In the latter case the operation of the original system can be exhaustively analyzed within the framework of the aggregated model and one faces the problems of defining the rules for introducing macrovariables specifying loss of information and accuracy recovering original variables from aggregates etc We consider also in detail the so called iterative aggregation approach It constructs an iterative process at every step of which a macroproblem is solved that is simpler than the original problem because of its lower dimension Aggregation weights are then updated and the procedure passes to the next step Macrovariables are commonly used in coordinating problems of hierarchical optimization

*Large-scale Optimization* Vladimir Tsurkov, 2013-03-09 Decomposition methods aim to reduce large scale problems to simpler problems This monograph presents selected aspects of the dimension reduction problem Exact and approximate aggregations of multidimensional systems are developed and from a known model of input output balance aggregation methods are categorized The issues of loss of accuracy recovery of original variables disaggregation and compatibility conditions are analyzed in detail The method of iterative aggregation in large scale problems is studied For fixed weights successively simpler aggregated problems are solved and the convergence of their solution to that of the original problem is analyzed An introduction to block integer programming is considered Duality theory which is widely used in continuous block programming does not work for the integer problem A survey of alternative methods is presented and special attention is given to combined methods of decomposition Block problems in which the coupling variables do not enter the binding constraints are studied These models are worthwhile because they permit a decomposition with respect to primal and dual variables by two level algorithms instead of three level algorithms Audience This book is addressed to specialists in operations research optimization and optimal control

Aggregation of Network Flow Problems Vernon Edward Francis, 1985 Aggregation is a fundamental and widely used method of model simplification in management science operations management economics database systems and related fields It has also been used as a technical device in algorithm and software design for large scale optimization problems particularly network flow problems This class of problems is particularly amenable to aggregation owing to the

special structural properties of networks This research investigates aggregation of the capacitated transshipment problem The author establishes a new framework for aggregation of this class of problems and provide an important characterization of arc types as a necessary preliminary to implementation An aggregation procedure and a partition refinement process which generates a sequence of successively restricted aggregate problems are developed within this framework A disaggregation methodology is defined that maps a feasible basic solution of the current aggregate problem to a basic solution of the next aggregate problem in the sequence This map is incorporated into a complete algorithm which employs the aggregation disaggregation concepts developed here Finally the results of this research are verified and tested in a computer implementation Author *A Bridge Between Control Science and Technology: Large-scale systems, decision-making, mathematics of control* International Federation of Automatic Control.
