

Evolving Earth

Our planet passed through vastly different stages on its way to becoming a habitable world.

Earth Forms

Our world accreted from a Sun-circling disk of gas and dust about 4.5 billion years ago – then collided with a Mars-sized body about 50 million years later, leading to formation of the Moon.

Earth Cools

The surface cooled rapidly, achieving a hot but solid crust, with early oceans and impact basins filled with lava by about 4.3 billion years ago.

Life Begins

The earliest life forms might have appeared during the Archean Era some 3.7 billion years ago – or even earlier. Oceans could have been tinged green by iron ions. Life forms relying on oxygen, and an oxygenated atmosphere, did not arise until much later.

Earth Today

Our world of abundant life, with its oxygen-rich atmosphere, likely would be recognized as habitable from many light-years away. But the presence of oxygen might not have been detectable even as recently as 600-500 million years ago.
