

Earthquakes and the Earth's Internal Structure

Seismologists study shock, or seismic, waves as they travel through the Earth's interior. These waves originate from natural sources like earthquakes, and from artificial sources like man-made explosions. Knowing how the waves behave as they move through different materials enables us to learn about the layers that make up the Earth. Seismic waves tell us that the Earth's interior consists of a series of concentric shells, with a thin outer crust, a mantle, a liquid outer core, and a solid inner core.

The seismic waves called **P waves** pass through the core and are detected on the far side of the Earth. Slight delays received in the P wave shadow zone suggest there is a solid inner core deflecting some waves.

The seismic waves called **S waves** do not travel through liquid. We know that the outer core is liquid because of the shadow it casts in S waves.

P waves, meaning primary waves, travel fastest and thus arrive first at seismic stations. The **S**, or secondary, waves arrive after the P waves.
