The traditional methods of solid waste management by disposal in 'waste landfills'; wastewater treatment by 'sewage treatment plants'; land remediation by 'earth cutting and soil excavation'; and agriculture production by 'aggressive tillage and land plough' & use of agrochemicals are all highly expensive & also pollute the environment, emit greenhouse gases inducing global warming. Vermicomposting by earthworms can divert 60-70 % solid wastes from landfills. Vermifiltration involves 'low energy' and no 'sludge' is formed which requires safe disposal in landfills. Vermiremediation is 'on-site' without earth cutting and soil excavation. With continued use of vermicompost farm soils becomes too soft requiring very low tillage. Earthworms works as natural ploughman. We have successfully experimented in 'vermicomposting of solid wastes', 'vermifiltration of 'municipal and industrial wastewater', 'vermiremediation of chemically contaminated soils' and 'vermi-agroproduction of cereal and vegetables crops' with amazing results. Wastes are degraded by over 75% faster & the end-product is highly nutritive organic fertilizer; BOD and TDSS of wastewater is reduced by over 95% & the water become 'disinfected & detoxified' to be used in agriculture; chemicals from the contaminated soils are significantly removed also making it fertile; growths of crop plants are enhanced by 30-40% higher over chemical fertilizers by vermicompost.

Keywords: Soil vermi-remediation, waste vermi-composting, wastewater vermi-filtration, health protective organic foods by vermicompost

INTRODUCTION

Traditionally civil engineering have played important role in human waste management and land remediation programs albeit at the cost of environment. Construction of 'waste-landfills' and wastewater treatment by installing 'sewage treatment plants' (STPs), remediation of chemically contaminated lands by 'earth cutting and soil excavation' and dumping them in 'secured landfills' are all civil engineering methods incurring huge cost of construction, operation and maintenance and also emit powerful greenhouse gases like CH₄ and N₂O besides trace toxic gases from

landfills and by the heavy use of fossil fuels in the operation of machineries and electricity in operation of STPs.

Now environment has become a very important issue and 'development and environment' have to go together for 'human sustainability' on earth.
