

# COLLECTED WORKS ON THEORETICAL BIOPHYSICS \*

In the unknown field of science, no foothold is absolutely secure. As for those who firstly step into this field they can only hope that the mistakes they may make would be a credit to them.

A. Saant Gyorgyi

## PREFACE

This volume is a collection of the major theses on theoretical biophysics from 1983 to 1995 by the present author and his collaborators. Originally the treatises were separately published and part of them scattered in different issues of *(Acta Scientiarum Naturalium Universitatis Intramongolicae)*. In August 1995, they were compiled into a collection and published by the Publishing House of Inner Mongolia University. This time the works are translated into English with some new papers added to the volume.

Since theoretical biophysics is a newly developed science, no unanimity has been reached by the scientific researchers as to the content it should cover. According to the author, either at present or during a long period of time to come, the main problems it may involve are, Firstly, the important theoretical questions connected with the origin and early evolution of life, such as the origin of chirality, the origin of genetic code and the accumulation of information and the formation of order in the nucleic acids. Secondly, the determination of molecular conformation (spatial structure) from the amino acid and nucleotide sequence, and, on the basis of which, the investigation of the relationship between structure and function from the point of dynamics. Thirdly, the characteristics of self-organization in morphogenesis, individual development and other aspects of living activity. Fourthly, the information processing in the sense organs and nervous system. We have concentrated our work on the first two aspects in recent years.

Papers in the collection are classified into 23 groups under A to W according to their content. Groups A and B include review articles written by us. The papers in Group A summarize our work in three main directions, namely genetic code, molecular sequence and conformation dynamics. The papers in Group B are essays on biophysics written by the author on the request of *(Physics)* and *(Exploration of Nature)*, in which B1 discusses a possible reverse line—code, sequence, conformation, and dynamics—of theoretical biology. The views in Group B have been included in a monograph entitled *(A physicist looks at life)*. The 21 groups from C to W are in turn divided into four parts. Part 1 (C—E) is devoted to the problems of biochirality and genetic code which are related to the origin of life. Part 2 (F—N) discusses the evolution and expression of genes. Part 3 (O—S) investigates the problem concerning sequence, conformation and conformation dynamics. Part 4 (T—W) are works related to the biological self-organization. The papers are compiled here largely in their original forms. To save space, however, certain repetitions are omitted and about half of them are included only in abstracts.

Crick made a brilliant exposition as to the role of theoretical concepts and formulations in life science as well as how a theoretical worker should work in the biological research. "There
