Averagecase Analysis Of Numerical Problems:

Average-Case Analysis of Numerical Problems Klaus Ritter,2007-05-06 The average case analysis of numerical problems is the counterpart of the more traditional worst case approach The analysis of average error and cost leads to new insight on numerical problems as well as to new algorithms The book provides a survey of results that were mainly obtained during the last 10 years and also contains new results The problems under consideration include approximation optimal recovery and numerical integration of univariate and multivariate functions as well as zero finding and global optimization Background material e g on reproducing kernel Hilbert spaces and random fields is provided Essays on the Complexity of Continuous Problems Erich Novak, Henryk Woźniakowski,2009 This book contains five essays on the complexity of continuous problems written for a wider audience The first four essays are based on talks presented in 2008 when Henryk Wozniakowski received an honorary doctoral degree from the Friedrich Schiller University of Jena The focus is on the introduction and history of the complexity of continuous problems as well as on recent progress concerning the complexity of high dimensional numerical problems The last essay provides a brief and informal introduction to the basic notions and concepts of information based complexity addressed to a general readership Encyclopaedia of Mathematics Michiel Hazewinkel,2012-12-06 This is the second supplementary volume to Kluwer s highly acclaimed eleven volume Encyclopaedia of Mathematics This additional volume contains nearly 500 new entries written by experts and covers developments and topics not included in the previous volumes These entries are arranged alphabetically throughout and a detailed index is included This supplementary volume enhances the existing eleven volumes and together these twelve volumes represent the most authoritative comprehensive and up to date Encyclopaedia of Mathematics available Stochastic and Global Optimization G. Dzemyda,V. Saltenis,A. Žilinskas,2006-04-11 In the paper we propose a model of tax incentives optimization for investment projects with a help of the mechanism of accelerated depreciation Unlike the tax holidays which influence on effective income tax rate accelerated depreciation affects on taxable income In modern economic practice the state actively use for an attraction of investment into the creation of new enterprises such mechanisms as accelerated depreciation and tax holidays The problem under our consideration is the following Assume that the state region is interested in realization of a certain investment project for example the creation of a new enterprise In order to attract a potential investor the state decides to use a mechanism of accelerated tax depreciation The following question arise What is a reasonable principle for choosing depreciation rate From the state s point of view the future investor s behavior will be rational It means that while looking at economic environment the investor choose such a moment for investment which maximizes his expected net present value NPV from the given project For this case both criteria and investment rule depend on proposed by the state depreciation policy For the simplicity we will suppose that the purpose of the state for a given project is a maximization of a discounted tax payments into the budget from the enterprise after its creation Of course these payments depend on the moment of investor s entry and

therefore on the depreciation policy established by the state Complexity and Information J. F. Traub, Arthur G. Werschulz, 1998-12-10 The twin themes of computational complexity and information pervade this 1998 book It starts with an introduction to the computational complexity of continuous mathematical models that is information based complexity This is then used to illustrate a variety of topics including breaking the curse of dimensionality complexity of path integration solvability of ill posed problems the value of information in computation assigning values to mathematical hypotheses and new improved methods for mathematical finance The style is informal and the goals are exposition insight and motivation A comprehensive bibliography is provided to which readers are referred for precise statements of results and their proofs As the first introductory book on the subject it will be invaluable as a guide to the area for the many students and researchers whose disciplines ranging from physics to finance are influenced by the computational complexity of continuous problems

Fluctuation Theory for Lévy Processes Ronald A. Doney, 2007-04-19 Lévy processes in continuous time with stationary and independent increments are named after Paul Lévy who made the connection with infinitely divisible distributions and described their structure They form a flexible class of models which have been applied to the study of storage processes insurance risk queues turbulence laser cooling and of course finance where the feature that they include examples having heavy tails is particularly important Their sample path behaviour poses a variety of difficult and fascinating problems Such problems and also some related distributional problems are addressed in detail in these notes that reflect the content of the course given by R Doney in St Flour in 2005

Construction of Global Lyapunov Functions Using Radial Basis Functions Peter Giesl, 2007-04-04 The basin of attraction of an equilibrium of an ordinary differential equation can be determined using a Lyapunov function A new method to construct such a Lyapunov function using radial basis functions is presented in this volume intended for researchers and advanced students from both dynamical systems and radial basis functions Besides an introduction to both areas and a detailed description of the method it contains error estimates and many examples
