development ranging from what may be conveniently described as the life support systems gaseous exchange provision of energy etc to the of hormones in avian development Avian Embryology Ambika Prasad Diwan,1995 Embryology Is A Branch Of Biology Which Has A Most Immediate Bearing On The Problems Of Life It Has Become An Immense Field Whose Confines Are Difficult To Delineate The Focus Has Been And Remains On The Embryos On The Gradual Emergence Of Form And Structure From What Appears To Be A Very Modest Beginning The Essence Of Embryonic Development Is Transition From One Stage To Another Embryo Is A Fleeting Stage A Continuum Along The Axis Of Time The Present Volume Avian Embryology Comprising Of Fourteen Chapters Deals With The Different Stages Development Of Avian Embryo

Sharpe,Ivor Mason,2008-02-02 Most people have some interest in embryos this probably results in part from their interest in understanding the biological origins of themselves and their offspring and increasingly concerns about how environmental change such as pollution might affect human development Obviously ethical considerations preclude experimental studies of human embryos and consequently the developmental biologist has turned to other species to examine this process Fortunately the most significant conclusion to be drawn from the experimental embryology of the last two decades is the manner in which orthologous or closely related molecules are deployed to mediate similar developmental processes in both vertebrates and invertebrates The molecular

mechanisms regulating processes fundamental to most animals such as axial patterning or axon guidance are frequently conserved during evolution It is now widely believed that the differences between phyla and classes are the result of new genes arising mostly by duplication and divergence of extant sequences regulating the appearance of derived characters Other vertebrates are obviously most likely to use the same developmental mechanisms as humans and within the vertebrate subphylum the parent degree of conservation of developmental mechanism is considerable It has long been recognized that particular vertebrate species offer either distinct advantages in investigating particular stages of development or are especially amenable to particular manipulations No single animal can provide all the answers because not all types of experiments can be carried out on a single species
