A. J. Patil, 2015 This book Bridge Deck Analysis provides bridge designers with the knowledge to understand the behaviour of bridge decks to be familiar with and to understand the various numerical modelling techniques to know which technique is most suited Design of reinforced concrete bridges is normally done on the basis of a structural analysis The purpose of the analysis is to find a distribution of sectional forces which fulfils equilibrium and is suitable for design In the past structural analyses were often done with simplified models for example two dimensional 2D equivalent beam or frame models Such a model is not able to describe the distribution of forces in transversal directions Therefore a design according to a 2D equivalent model will not be according to the true linear elastic distribution even though the design might fulfil requirements in ultimate limit state ULS after sufficient plastic redistribution When designing bridges it is today required that a structural analysis describes the actions of the structure in its entirety In practice this means that a 3D model has to be established Therefore several procedures exist and often differ between different companies level of education and designer Analysis and Design of Bridges C. exploration of future research possibilities in the scientific or engineering areas concerned The main topics covered by the present Advanced Study Institute were the mathematical modelling of bridges for better analysis and the scientific assessment of bridge behaviour for the introduction of improved design procedures It has been our observation that as a result of the range and depth of the lectures presented and the many informal discussions that took place ideas became fissile the stimulus never flagged and many gaps in the engineering knowledge of the participants were bridged Here we particularly wish to mention that valuable informal presentations of research work were made during the course of the Institute by Drs Friedrich Karaesmen Lamas and Parker

*The Behaviour of Bridge Deck Slabs Under Full Global Load*, 1990 Global effects are not normally considered in the design of bridge deck slabs in North America They were not investigated in the studies which were used to develop the empirical design rules for deck slab reinforcement in the Ontario Highway Bridge Design Code However conventional linear grillage analyses suggest that in some types of bridge the global transverse moments the moments induced in the deck slab by its action in distributing load between the beams can be very significant They can exceed the total moment capacity of slabs designed to the Ontario rules Tests on two half scale model bridges which were loaded to failure under full global load confirm that these moments have a large effect on the behaviour of the deck slab Despite this the tests show that the empirical design rules which have been developed to date are satisfactory These tests do however show that it is theoretically possible for a bridge to fail prematurely due to combined global and local effects even when both the slab and the beams have been independently assessed as adequate This effect which is potentially significant to the assessment of existing bridges is correctly predicted by non linear analysis For the covering abstract of the Conference see IRRD Abstract No 807839
