Control Systems Theory with Engineering Applications

Sergey E. Lyshevski, 2012-12-06 Dynamics systems living organisms electromechanical and industrial systems chemical and technological processes market and ecology and so forth can be considered and analyzed using information and systems theories For example adaptive human behavior can be studied using automatic feedback control As an illustrative example the driver controls a car changing the speed and steering wheels using incoming information such as traffic and road conditions This book focuses on the most important and manageable topics in applied multivariable control with application to a wide class of electromechanical dynamic systems A large spectrum of systems familiar to electrical mechanical and aerospace students engineers and scholars are thoroughly studied to build the bridge between theory and practice as well as to illustrate the practical application of control theory through illustrative examples It is the author's goal to write a book that can be used to teach undergraduate and graduate classes in automatic control and nonlinear control at electrical mechanical and aerospace engineering departments The book is also addressed to engineers and scholars and the examples considered allow one to implement the theory in a great variety of industrial systems The main purpose of this book is to help the reader grasp the nature and significance of multivariable control

Control Systems Vsevolod

Kuntsevich, Vyacheslav Gubarev, Yuriy Kondratenko, 2022-09-01 In recent years a considerable amount of effort has been devoted both in industry and academia towards the development of advanced methods of control theory with focus on its practical implementation in various fields of human activity such as space control robotics control applications in marine systems control processes in agriculture and food production Control Systems Theory and Applications consists of selected best papers which were presented at XXIV International conference on automatic control Automatics 2017 September 13-15 2017 Kyiv Ukraine organized by Ukrainian Association on Automatic Control National member organization of IFAC International Federation on Automatic Control and National University of Life and Environmental Sciences of Ukraine More

than 120 presentations were discussed at the conference with participation of the scientists from the numerous countries. The book is divided into two main parts: a first on Theory of Automatic Control (5 chapters) and the second on Control Systems Applications (8 chapters). The selected chapters provide an overview of challenges in the area of control systems design, modeling, engineering, and implementation, and the approaches and techniques that relevant research groups within this area are employing to try to resolve these. This book on advanced methods of control theory and successful cases in the practical implementation is ideal for personnel in modern technological processes, automation, and SCADA systems, robotics, space, and marine industries, as well as academic staff and master research students in computerized control systems, automatized and computer-integrated systems, electrical and mechanical engineering.

Mathematical Theory of Control Systems Design V.N. Afanasiev, V. Kolmanovskii, V.R. Nosov, 1996-01-31. The many interesting topics covered in Mathematical Theory of Control Systems Design are spread over an Introduction and four parts. Each chapter concludes with a brief review of the main results and formulae, and each part ends with an exercise section. Part One treats the fundamentals of modern stability theory. Part Two is devoted to the optimal control of deterministic systems. Part Three is concerned with problems of the control of systems under random disturbances of their parameters, and Part Four provides an outline of modern numerical methods of control theory. The many examples included illustrate the main assertions, teaching the reader the skills needed to construct models of relevant phenomena, to design nonlinear control systems, to explain the qualitative differences between various classes of control systems, and to apply what they have learned to the investigation of particular systems.

Audience: This book will be valuable to both graduate and postgraduate students in such disciplines as applied mathematics, mechanics, engineering, automation, and cybernetics.

Control Systems Sisil Kumarawadu, 2010. Control Systems Theory and Implementation contains a comprehensive coverage of mathematical modeling of dynamical systems, analog and digital control principles, controller design, and analysis of commercial microcontrollers, DSPs for control applications, and implementation of control systems using microprocessor-based systems. Theoretical contents of the book are presented as much practically oriented as possible. Most books on control systems contain extensive amount of theoretical contents but little information about the practical aspects and implementation. There are books on digital signal processing but with little emphasis on real-time control applications. Control engineering is one of the broadest sub-disciplines of Engineering that can not be covered in a single book. Too much of content in the book often makes it difficult for undergraduate students and beginners to figure out which of the contents should be the most relevant. This book starts with the basic fundamentals, modeling of dynamical systems, discusses analog and digital control theories, and practical implementation using microprocessor-based systems. The contents cover typical syllabi of a control systems undergraduate course and postgraduate level taught courses, and hence is an ideal text book in control systems for beginners.

Control Systems Theory and Applications for Linear Repetitive Processes Eric Rogers, Krzysztof Galkowski, David H. Owens, 2009-09-02 After motivating examples this monograph gives substantial new results on the analysis and control of linear repetitive processes These include further applications of the abstract model based stability theory which in particular shows the critical importance to the dynamics developed of the structure of the initial conditions at the start of each new pass the development of stability tests and performance bounds in terms of so called 1D and 2D Lyapunov equations It presents the development of a major bank of results on the structure and design of control laws including the case when there is uncertainty in the process model description together with numerically reliable computational algorithms Finally the application of some of these results in the area of iterative learning control is treated including experimental results from a chain conveyor system and a gantry robot system
