

than 1 ( $\approx 0.9$ ) for conventional airfoil sections, but is greater than 1 for NACA low-drag sections.

According to the theory of thin airfoils in a two-dimensional incompressible fluid, the center of pressure of the additional lift due to change of  $\alpha$  is located at  $1/4$ -chord aft of the leading edge. This point is called the *aerodynamic center*. If the moment coefficient is computed about the aerodynamic center, it does not vary with  $C_L$ . The symbol  $C_{M_0}$  or  $C_{M_{c/4}}$  is used to denote the moment coefficient referred to an axis located at the  $1/4$ -chord point. The aerodynamic center remains close to the  $1/4$ -chord point in a compressible fluid as long as the flow is *subsonic*; but it moves close to the mid-chord point if the flow is entirely *supersonic*.

The subscript 0 of the lift-curve slope  $a_0$  signifies that  $a_0$  is the value pertaining to an airfoil of infinitely long span. For wings of *finite span*

Fig. 1.12. Downwash and induced angle.

the lift-curve slope is smaller. In Prandtl's finite-wing theory, a wing is replaced by a *vortex line*. Since a vortex line cannot end at the wing tip, it must continue laterally out of the wing and become a *free vortex* (trailing vortex) in the fluid. The vertical velocity  $w$  induced by the trailing vortices is called the *induced velocity*. Because of the induced velocity, the direction of flow at the airfoil is changed by an amount  $\epsilon$ , which is given by the relation

$$\tan \epsilon = w/U \quad (9)$$

From Fig. 1.12 it is seen that the effective angle of attack  $\alpha_0$  is smaller than the geometric angle of attack  $\alpha$ . Assuming that  $w$  is infinitesimal compared with  $U$ , we may write

$$\alpha_0 = \alpha - \epsilon \doteq \alpha - \frac{w}{U} \quad (10)$$

The resultant force  $\rho U_{res} \Gamma$  acts in a direction normal to the resultant
