*The Theory of Binocular Vision* Ewald Hering, 2012-12-06 The Theory of Binocular Vision is a book about neurological control theory In this sense it was far ahead of its time for the formal development of control theory was many decades in the future when this book appeared in 1868 Hering s principal concept is that the control of eye movements is greatly simplified if there is only one neurological control system commanding the double eye as a single organ This idea leads directly to the first thorough exposition of what is now

known as Hering's law that the corresponding muscles of the two eyes are always equally innervated. As Hering eloquently states, it is one and the same impulse of will that directs both eyes simultaneously, as one can direct a pair of horses with single reins.

Ch 2 The 19th Century The book was written during an exciting era for physiological research. Before the mid 19th century the study of physiology had been limited to isolated efforts by great men who worked largely without colleagues or organized laboratories. Now for the first time of inquiry with many sensory physiology was becoming a living field, groups working simultaneously on fundamental problems. Like the classical Greeks before them in philosophy, the physiologists of the 19th century were defining in a burst of creative energy the problems that would shape subsequent inquiry and like the Greeks they produced a splendid period of science.
