Cell Adhesion Molecules:

Adhesion Molecules in Health and Disease Paul,1997-05-16 Provides an overview of the structure transcription regulation and binding characteristics of cellular adhesion molecules and their ligands in the maintenance of function immunological reactions and inflammatory processes with organ systems The text examines the role of adhesion molecules in biological processes such as morphogenesis blood coagulation tumour metastasis bone tissue remodelling and transplant rejection

Cell Adhesion Molecules Martin E. Hemler, Enrico Mihich,2012-12-06 The Fourth Annual Pezcoller Symposium entitled Adhesion Molecules Cellular Recognition Mechanisms was held in Rovereto Italy June 24 26 1992 and was focussed on the detailed mechanisms whereby cells utilize certain integral membrane proteins to perceive their surrounding environment and interact with it With timely presentations and stimulating discussions this Symposium addressed the genetics and biochemistry of adhesion molecules the regulation of their functions and their role in cancer and the immune system Emphasis was given to adhesion proteins in the integrin family because of the widespread distribution of this group of molecules and its important role in essentially all eukaryotic biological systems The regulation of integrin genes and their expression are discussed in detail as are specific aspects of the genetics of fibronectin The molecular basis for the regulation of certain integrins the function of these proteins in determining cell adhesion and the consequences of this adhesion for the function of the cells involved are discussed The role of certain integrins in stimulating signal transduction the essential involvement of integrins in conditioning the function of T and NK cells function the heterogeneity of integrins and its biological consequences and the role of cell adhesion molecules in tumor cells invasion and metastases are all extensively analyzed New information was presented on the role of CD44 and splice variants in normal differentiation and tumor progression

Colman,1997-02-24 One prerequisite for the evolution of multicellular organisms was the invention of mechanisms by which cells could adhere to one another At some point in our history dividing cells no longer went their separate protozoic ways in the primordial oceans but instead found that by maintaining an association by sticking together but not fusing numerous evolutionary advantages became possible The subsequent development of specialized tissues and organs depended on the elaboration of incredibly sophisticated regulatable cell to cell adhesion mechanisms which are known to operate in biological processes as diverse as the growth of the embryo the immune response the establishment of connections between nerve cells and arteriosclerosis to name just a few Although we can only guess at the ancestral mechanisms that fostered the first primitive intercellular unions

some one billion years ago we now recognize contemporary molecular themes with presumably ancient origins that mediate cell cell interactions The chapters in this book serve as useful thought provoking but not exhaustive commentaries on contemporary topics within the broad field of cell adhesion If the reader detects a slight tilt toward those adhesion molecules that function in the nervous system this is merely a reflection of this editor s interests biases and of course limitations

The Adhesive Interaction of Cells David Garrod,A.J. North,M.A.J. Chidgey,1999-03-31 The aim of *The Adhesive Interaction of Cells* has been to assemble a series of reviews by leading international experts embracing many of the most important recent developments in this rapidly expanding field The purpose of all biological research is to understand the form and function of living organisms and by comprehending the normal to find explanations and remedies for the abnormal and for disease conditions The molecules involved in cell adhesion are of fundamental importance to the structure and function of all multicellular organisms In this book the contributors focus on the systems of vertebrates especially mammals since these are most relevant to human disease It would have been equally possible to concentrate on developmental processes and adhesion in lower organisms A major function of adhesion molecules is to bind cells to each other or to the extracellular matrix but they are much more than glue Adhesions in animal tissues must be dynamic forming persisting or declining in regulated fashion to facilitate the mobility and turnover of tissue cells Moreover the majority of adhesion molecules are transmembrane molecules and thus provide links between the cells and their surroundings This gives rise to another major function of adhesion molecules the capacity to transduce signals across the hydrophobic barrier imposed by the plasma membrane Such signal transduction is crucially important to many aspects of cellular function including the regulation of cell motility gene expression and differentiation The work in this book progresses through four sections Part I discusses the four major families of adhesion molecules themselves the integrins Green and Humphries the cadherins Stappert and Kemler the selectins Tedder et al and the immunoglobulin superfamily Simmons part 2 considers junctional complexes involved in cell interactions focal adhesions and adherens junctions Ben Ze ev desmosomes Garrod et al and tight junctions Citi and Cordenonsi The signaling role of adhesion molecules is the focus of part 3 through integrins and the extracellular matrix Edwards and Streuli through platelet adhesion Du and Ginsberg and in the nervous system Hemperley In part 4 the aim is to show how adhesive phenomena contribute to important aspects of cell behavior and human health Leukocyte trafficking Haskard et al cancer metastasis Marshall and Hart cell migration Paleck et al and implantation and placentation Damsky et al are the topics considered in depth The different sections are of course not mutually exclusive it is both undesirable and impossible to separate structure from function when considering cell adhesion Each chapter has its unique features but some overlap is both inevitable and valuable since it provides different perspectives on closely related topics We hope that the whole contributes a valuable and stimulating consideration of this important topic

Cell Adhesion
G. Berx,2004-07-09 This book provides an overview of the main topics of current cell adhesion research including structural

analyses of cell adhesion molecules and studies to their functional role in vitro and in vivo The present volume focuses on the four major families of cell adhesion receptors i e the cadherins the integrins the Ig superfamily and the selectin based adhesion system which are discussed in detail by numerous experts in the field *The Adhesion Molecule Factsbook* Rod Pigott,Christine Power,1993 How do you keep track of basic information on the proteins you work with Where do you find details of their physicochemical properties amino acid sequences gene organization Are you tired of scanning review articles primary papers and databases to locate that elusive fact The new Academic Press FactsBook series will satisfy scientists and clinical researchers suffering from information overload Each volume provides a catalogue of the essential properties of families of molecules Gene organization amino acid sequences physiochemical properties and biological activity are presented using a common easy to follow format Taken together they compile everything you wanted to know about proteins but were too busy to look for Provides information on alternative nomenclature tissue distribution and regulation of expression ligands gene organization and chromosomal location protein structure and molecular weights amino acid sequence of the most commonly studied organisms PIR SWISSPROT and EMBL GenBank accession numbers biological function key references *Molecular Biology of Cell Adhesion Molecules* Michael A. Horton,1996-12-16 This series is designed to bridge the gap between pure research in the biomedical sciences and its practical application in clinical medicine The objective is to promote the understanding of the molecular basis of human physiology and disease and new techniques for diagnosis and treatment Primarily intended for graduate students of medicine the books will also be of use to molecular biologists biochemists physiologists pharmacologists and biotechnologists as well as medical practitioners and technicians who seek to update their knowledge There has been an explosion of interest in adhesion molecules in recent years and this has led to a greater understanding of cell behaviour in physiological and pathological situations What has become increasingly clear is that data from enquiry based research are eminently suited to be translated into applied clinical research This timely and informative book introduces the topic of cell adhesion to the non specialist and signifies areas where continuing research may yield results of clinical benefit It will appeal to a wide audience including clinicians and postgraduate researchers in immunology and molecular biology and those involved in rheumatology dermatology gastroenterology cardiology and haematology *Adhesion Molecules* Craig D. Wegner,1994-11-30 The consequences of diseases involving the immune system such as AIDS and chronic inflammatory diseases such as bronchial asthma rheumatoid arthritis and atherosclerosis now account for a considerable economic burden to governments worldwide In response there has been an enormous research effort investigating the basic mechanisms underlying such diseases and a tremendous drive to identify novel therapeutic applications for their prevention and treatment Though a plethora of immunological studies have been published in recent years little has been written about the implications of such research for drugs development As a consequence this area has not gained the prominence of other fields such as molecular pharmacology or neuropharmacology

and a focal information source for the many pharmacologists interested in diseases of the immune system remains unpublished The Handbook of Immunopharmacology series provides such a source through the commissioning of a comprehensive collection of volumes on all aspects of immunopharmacology Editors have been sought after for each volume who are not only active in their respective areas of expertise but who also have a distinctly pharmacological bias to their research The series follows three main themes each represented by volumes on individual component topics The first covers each of the major cell types and classes of inflammatory mediators cells and mediators The second covers each of the major organ systems and the diseases involving the immune and inflammatory responses that can effect them systems The third covers different classes of drugs currently used to treat these diseases as well as those under development drugs This volume provides a comprehensive overview of the adhesion molecules processes and concepts that govern both inflammatory and infectious diseases and also deals in detail with the specific in vivo pathways involved The first chapter introduces some of the molecules that mediate leukocyte adhesion and ranges from their discovery using monoclonal antibodies and a congenital adhesion deficiency to their antagonism in preliminary clinical trials as novel therapeutics An in depth analysis of the structure distribution and function of the cell surface glycoproteins that regulates lymphocyte specific immune response granulocyte acute inflammatory response and metastatic cell malignant processes adhesions respectively is provided by the next three chapters Chapters 5 and 7 detail the molecular structure intracellular pathways specificity of carbohydrate interactions and signalling of the molecules that regulate leukocyte leukocyte and leukocyte mesenchymal cell interactions There follows an exploration into the contributions of specific molecules in inflammatory diseases in various organs from chapters 8 11 The concluding part is unique to this volume by reviewing the comparable and in some cases same cell surface molecules that mediate virus bacteria and parasite interactions with host cells The research is far from complete but Adhesion Molecules is extremely comprehensive and will be a valuable resource for many a year to come

Cell Adhesion Molecules Vladimir Berezin, Peter S. Walmod, 2013-11-18 Cell Adhesion Molecules Implications in Neurological Diseases contains review articles on recent developments in the field of neural cell adhesion molecules CAMs The main focus is on the role of cell adhesion molecules in various neurological and neurodegenerative diseases This perspective has been essentially overlooked in recently published books on neural CAMs In addition the contributors cover many newly identified cell adhesion molecules and some that have not received much attention in recent years This books fills an important gap in the currently available literature

Signaling Through Cell Adhesion Molecules Jun-Lin Guan, 2019-04-30 The field of signal transduction research is one of the fastest growing in all of biomedical research in recent years Signaling through cell adhesion molecules have long been of interest because of their importance in embryonic development homeostasis immune responses wound healing and malignant transformation However it is only recently re

Cell Adhesion and Human Disease Joan Marsh, Jamie A. Goode, 2008-04-30

Experts in their respective fields present papers concerned with the range of human diseases caused by defective or abnormal functioning of cell adhesion molecules. Discusses new therapeutic approaches to these maladies.

The Sticky Synapse Michael Hortsch, Hisashi Umemori, 2009-06-07 The molecular mechanisms which are responsible for the functional differences between the various types of neuronal synapses have become one of the central themes of modern neurobiology. It is becoming increasingly clear that a misregulation of synaptogenesis and synaptic remodeling and dysfunctional neuronal synapses are at the heart of several human diseases both neurological disorders and psychiatric conditions. As synapses present specialized cellular junctions between neurons and their target cells it may not come as a surprise that neural cell adhesion molecules (CAMs) are of special importance for the genesis and the maintenance of synaptic connections. Genes encoding adhesive molecules make up a significant portion of the human genome and neural CAMs even have been postulated to be a major factor in the evolution of the human brain. These are just some of the many reasons why we thought a book on neural CAMs and their role in establishing and maintaining neuronal synapses would be highly appropriate for summarizing our current state of knowledge. Without question over the near future additional adhesive proteins will join the ranks of synaptic CAMs and our knowledge and how these molecules enable neurons and their targets to communicate effectively will grow.

Cellular and Molecular Mechanisms of Inflammation Charles G. Cochrane, Michael A. Gimbrone, 2013-10-22 Cellular and Molecular Mechanisms of Inflammation: Vascular Adhesion Molecules presents the study of the structure and function of constitutive and inducible cell surface structures which contribute to the temporal and spatial patterns and cellular selectivity of leukocyte vessel wall interactions. The book addresses the rapidly expanding field of vascular adhesion molecules. Contributed articles discuss SELECTINS, a family of structurally related glycoproteins that contain lectin-like domains that confer leukocyte selective adhesive functions which include ELAM-1, Endothelial Leukocyte Adhesion Molecule-1, GMP-140, PADGEM, CD62 and LAM-1, gp90^m, L-ECAM-1, LECAM-1. Other adhesive molecules such as CD44 and members of the immunoglobulin family of cell surface glycoproteins including ICAM-1, CD54, VCAM-1, INCAM-110 and LP-AM-1 are also considered. The text will be very useful to cytologists, molecular biologists, physiologists and pharmacologists.
